

A message from GARFIELD

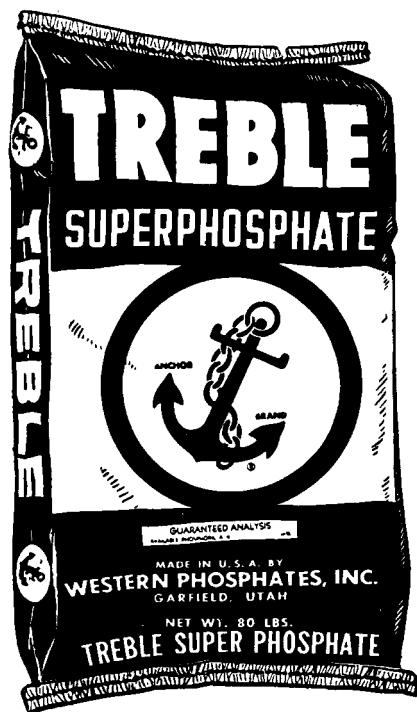

In 1953 Western Phosphates, Inc. built the huge, multi-million-dollar plant at Garfield, Utah, to produce high-quality, high-analysis Treble Superphosphate.

During the next two years plant facilities were greatly increased to better serve the needs of our customers.

Early this year we announced the production of NEW, Pelleted 11-48-0, another top quality product from our Garfield plant.

Next came another outstanding AMMONIUM PHOSPHATE, 16-20-0, a product which has immediately established itself as one of the highest-quality fertilizer products yet produced.

Soon still another exceptional new product will be announced. So keep "looking to Garfield."
