### Absolute Configuration of Migrastatin, a Novel 14-Membered Ring Macrolide

Sir:

Migrastatin (**1**), a novel 14-membered ring macrolide, was isolated from a culture broth of *Streptomyces* sp. MK929-43F1.<sup>1)</sup> It inhibits both anchorage-independent growth and migration of human tumor cells.<sup>2)</sup>

Previously, we reported the planar structure and geometry of the three olefins in the 14-membered ring of **1**.<sup>3)</sup> In this communication, we describe the absolute structure of **1** determined by X-ray crystallographic analysis as shown in Fig. 1.

Treatment of **1** (28.9mg) with *p*-bromophenacyl bromide (56.0 mg) and K<sub>2</sub>CO<sub>3</sub> (9.0 mg) in DMF (1 ml) for 40 hours at room temperature gave crude *N*-phenacylated migrastatin. Pure *N*-*p*-bromophenacylmigrastatin (**2**, 7.2 mg) was obtained, after purification on preparative SiO<sub>2</sub> TLC twice with toluene-acetone (2 : 1, R<sub>f</sub> 0.71) and then hexane-ethyl acetate (1 : 1, R<sub>f</sub> 0.20). Crystalline plates of **2** were obtained from MeOH-H<sub>2</sub>O. Physico-chemical properties: mp 134~137°C; [α]<sub>D</sub><sup>20</sup> +9.9° (c 0.48, MeOH); FAB-MS *m/z* 686 and 688 (MH<sup>+</sup>); IR (KBr, cm<sup>-1</sup>) 1707, 1682; <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>) δ 0.97 (3H, d, *J*=7.0 Hz, 22-H), 1.13 (3H, d, *J*=7.0 Hz, 24-H), 1.87 (3H, d, *J*=1.5 Hz, 23-H), 2.53 (2H, t, *J*=7.0 Hz, 16-H), 3.31 (3H, s, 27-H), 2.79 (1H, s, 9-OH), 5.10 (1H, d, *J*=10.0 Hz, 13-

H), 5.16 (2H, s, 28-H), 7.64 (2H, m, 32-H and 34-H), 7.82 (2H, m, 31-H and 35-H).

The X-ray crystallographic study of **2** was carried out as described below.

A colorless plate crystal of **2** (C<sub>35</sub>H<sub>44</sub>NO<sub>8</sub>Br) having approximate dimensions of 0.20×0.08×0.03 mm was mounted in a loop. All measurements were made on a Rigaku RAXIS-RAPID Imaging Plate diffractometer with graphite monochromated Mo-Kα radiation at -150°C. The crystal data of **2** are shown in Table 1. Of the 11552 reflections which were collected, 4179 were unique (R<sub>int</sub>=0.112); equivalent reflections were merged. The linear absorption coefficient, μ, for Mo-Kα radiation is 12.3 cm<sup>-1</sup>. A symmetry-related absorption correction using the program ABSCOR<sup>4)</sup> was applied which resulted in transmission factors ranging from 0.75 to 0.96. The data were corrected for Lorentz and polarization effects. The structure was solved by direct methods<sup>5)</sup> and expanded using Fourier techniques.<sup>6)</sup> The non-hydrogen atoms were refined anisotropically. Hydrogen atoms were included but not refined. The final cycle of full-matrix least-squares refinement<sup>7)</sup> was based on 4161 observed reflections (I>3.00σ(I), 2θ<54.77) and 407 variable parameters and converged with unweighted and weighted agreement factors of R=0.146, R<sub>w</sub>=0.268 and R<sub>1</sub>=0.086 (for I>2.0σ(I) data). The maximum and minimum peaks on the final difference Fourier map corresponded to 0.63 and -0.77e<sup>-</sup>/Å<sup>3</sup>, respectively. The absolute configuration of the molecule was determined based on Flack's parameter, 0.044(32), and confirmed by the method of Bijvoet

inequality relationships. Comparing  $|\text{Fo}(\text{hkl})|/|\text{Fo}(\bar{h}\bar{k}\bar{l})|$  and  $|\text{Fc}(\text{hkl})|/|\text{Fc}(\bar{h}\bar{k}\bar{l})|$  for 172 Friedel pairs for which the differences  $\frac{||\text{Fc}(\text{hkl})| - |\text{Fc}(\bar{h}\bar{k}\bar{l})||}{\sqrt{\sigma\text{F}_0(\text{hkl})^2 + \sigma(\text{F}_0(\bar{h}\bar{k}\bar{l}))^2}}$  are greater than 1.0, 159 pairs showed consistently the absolute configuration in Fig. 2. All calculations were performed using the teXsan<sup>8)</sup> crystallographic software package of Molecular Structure Corporation.

Results of modified Mosher's method<sup>9)</sup> were also in agreement with the absolute stereochemistry elucidated by

the X-ray crystallographic analysis as shown in Fig. 3.

Consequently, four asymmetric centers in the lactone ring and one in the side chain of migrastatin (**1**) were determined to be 8*S*, 9*S*, 10*R*, 13*R* and 14*S*, respectively. Among them, stereochemistries of C8, 10 and 13 are consistent with a configurational model for macrolide antibiotics proposed by CELMER.<sup>10)</sup>
