

ANNOUNCEMENT**Plastics for Engineers**

Yarsley Research Laboratories of Chessington, England, invite co-sponsors for an independent evaluatory project aimed at providing designers with an authoratitive comparison of the more important thermo-plastics. Using full scale research and testing facilities established over 40 years, a newly developed technique will be employed to provide information of a meaningful and practical value to processors, particularly injection molders, such that a judicious choice of material will not only minimize molding problems but, by covering such problems as shrinkage, creep, and tendency to fracture when notched, will lead to end products of greater stability.

To obtain a prospectus write direct to The Yarsley Organisation, Clayton Road, Chessington, England.
