A Property of Chebyshev Polynomials

RONALD A. DEVORE*

Department of Mathematics, Oakland University, Rochester, Michigan 48063 Communicated by T. J. Rivlin

We shall prove the following.

THEOREM. If P is a polynomial of degree n with n distinct zeros in [-1, 1] and

$$P(\cos(k\pi/n)| = 1, \qquad k = 0, 1, ..., n,$$
(1)

then either $P(x) = T_n(x)$ or $P(x) = -T_n(x)$, where $T_n(x) = \cos(n \arccos(x))$ is the Chebyshev polynomial of degree n.

This theorem answers affirmatively a problem posed by C. Micchelli and T. Rivlin at the conference on "Linear Operators and Approximation" held in Oberwolfach in the summer of 1971, (see [1, p. 498]).

For the proof, we will use a lemma due to W. W. Rogosinski [2]. Throughout, we assume that P is a polynomial of degree n with n distinct zeros in [-1, 1], satisfying (1).

LEMMA 1. (Rogosinski [2]). If $P(x) = a(x - x_1) \cdots (x - x_n)$, then $|a| \leq 2^{n-1}$.

Proof of Theorem. We wish to show that if $P(x) = a(x - x_1) \cdots (x - x_n)$, then, $|a| > 2^{n-1}$, or $P = \pm T_n$. This coupled with Lemma 1 proves the theorem. We expand P in terms of Chebyshev polynomials as

$$P(x) = \sum_{0}^{n} \lambda_{k} T_{k}(x).$$

Since the coefficient of x^n in T_n is 2^{n-1} , we have $\lambda_n 2^{n-1} = a$. Now,

$$P(\cos \theta) = \sum_{0}^{n} \lambda_k \cos k\theta = 1/2 \sum_{0}^{n} \lambda_k (e^{ik\theta} + e^{-ik\theta}).$$

$$R(z) = \frac{1}{2} z^n \sum_{0}^n \lambda_k (z^k + z^{-k}).$$

At each 2nth root of unity $e^{ik\pi/n}$, $|R(e^{ik\pi/n})| = 1$, k = 1,..., 2n. Also, R has all its zeros on the unit circle, namely at the points $z_1,..., z_{2n}$, where z_k is that point on the unit circle with $\operatorname{Re}(z_k) = x_k$ and $\operatorname{Im}(z_k) > 0$, k = 1,..., n and $z_{k+n} = \overline{z}_k$, k = 1,..., n. Hence,

$$R(z) = \frac{1}{2}\lambda_n(z-z_1)\cdots(z-z_{2n}).$$

The polynomial $z^{2n} - 1$, vanishes at each of the 2nth roots of unity and so

$$z^{2n} - 1 = (z - e^{i\pi/n}) \cdots (z - e^{i2n\pi/n}).$$

This gives

$$1 = \prod_{k=1}^{2n} |R(e^{ik\pi/n})| = \left(\frac{|\lambda_n|}{2}\right)^{2n} \prod_{j,k=1}^{2n} |e^{ik\pi/n} - z_j|$$
$$= \left(\frac{|\lambda_n|}{2}\right)^{2n} \prod_{j=1}^{2n} |z_j^{2n} - 1| \le |\lambda_n|^{2n}.$$
(2)

The last inequality is strict unless each term $z_j^{2n} - 1$ is equal to -2. One checks easily that this would imply that either $P = T_n$ or $P = -T_n$. Thus, if $P \neq \pm T_n$, then (2) shows that

$$1 < |\lambda_n| = 2^{-n+1} |a|,$$

as desired.

Remark. Our original proof did not use Lemma 1. This lemma was kindly pointed out to us by Michelli and Rivlin and this considerably simplified our original proof.
