# Convergence Rates of $\alpha$-Stable Difference Methods 

E. Görlich and D. Pontzen*<br>Lehrstuhl A für Mathematik, RWTH Aachen, Templergraben 55, 5100 Aachen, West Germany<br>Communicated by P. L. Butzer<br>Received August 12, 1983

## I. Introduction

The purpose of this note is to prove a quantitative Lax type theorem expressed in terms of $\alpha$-stability and $\alpha$-well-posedness. Here the term "quantitative" means that in the consistency hypothesis upon the difference method a rate of convergence is prescribed and that in the convergence result a rate is obtained corresponding to the degree of smoothness of the initial value. Theorems of this sort have been established in a general Banach space setting by Butzer, Dickmeis, Nessel, and others [2, 4, 5, 7]. For specific $L_{p}$ spaces such theorems were proven by Peetre and Thomé $|10|$.

Our objective here is to work with $\alpha$-well-posedness for $0 \leqslant \alpha<1$, instead of the usual (strong) well-posedness, that is, to admit initial value problems

$$
\begin{equation*}
\frac{d}{d t} u=A u \quad(t>0), \quad u(0)=f \in X \tag{1.1}
\end{equation*}
$$

on a Banach space $X$, with the closed linear operator $A$ forming the infinitesimal generator of a semigroup $\{E(t) ; t>0\}$ of growth order $\alpha$ in the sense of Da Prato |6|. Essentially, the latter property requires that the operator norm of $E(t)$ satisfies

$$
\begin{equation*}
\|E(t)\| \leqslant M t^{-\alpha} e^{\omega t} \quad(t>0) \tag{1.2}
\end{equation*}
$$

For $\alpha>0$ this is a weaker property than strong well-posedness, to which it reduces for $\alpha=0$. Examples of initial value problems which are $\alpha$-well-posed for some $\alpha>0$ but not 0 -well-posed are frequently met among systems of differential equations of the form (1.1) when the symbol of $A$ is not a normal matrix (cf. [8]; there also is given a characterization of $\alpha$ - well-posedness analogous to the Kreiss theorem).

[^0]To $\alpha$-well-posedness there corresponds the property of $\alpha$-stability for a difference scheme $\left\{E_{k} ; 0<k \leqslant k_{0}\right\}$ of bounded linear operators on $X$. depending continuously on $k$. This requires the $n$th iterate of $E_{k}$ to satisfy

$$
\begin{equation*}
\left\|E_{k}^{n}\right\| \leqslant C(n k)^{-\alpha} e^{K n k} \quad\left(0<k \leqslant k_{0}, n \in \mathbb{N}\right) \tag{1.3}
\end{equation*}
$$

for certain constants $C, K$. Again see $|8|$ for a characterization.
In Section 2 a quantitative Lax-type theorem on a general Banach space $X$ will be given, and in Section 3 this will be made more precise by specializing $X$ to the Lebesgue space $L_{p}^{\prime}$.

## 2. General Theorem

A difference scheme is said to be consistent with (1.1) of order $\varphi(k)$ on some linear subspace $D$ of $X$ if, for each $T>0$, there is a constant $C_{0}$ such that, for each $g \in D$,

$$
\begin{equation*}
\left\|\left|E_{k}-E(k)\right| E(t) g\right\| \leqslant C_{0} k \varphi(k)\|g\|_{D} \quad\left(0<k \leqslant k_{0}, 0 \leqslant t \leqslant T\right) . \tag{2.1}
\end{equation*}
$$

Here $E(0)$ denotes the identity operator, $\|\cdot\|_{D}$ is some norm on $D$, and $\varphi$ is an increasing function with $\varphi(x) \rightarrow 0$ as $x \rightarrow 0+$.

We further use the (Peetre) $K$-functional, which is defined by

$$
\begin{equation*}
K(t, f, X, D)=\inf _{k \in D}| | f f-g\left|+t\|g\|_{b}\right| . \tag{2.2}
\end{equation*}
$$

for $f \in X, t>0$.
Our first result is

Theorem 1. Let the initial value problem (1.1) be $\alpha$-well-posed for some $\alpha \in \mid 0,1)$, and let $\left\{E_{k} ; 0<k \leqslant k_{0}\right\}$ be a difference scheme which is consistent with (1.1) of order $\varphi(k)$ on a subspace $D$ of $X$. The following assertions are equivalent:
(a) the difference scheme is $\alpha$-stable:
(b) for each $T>0$ there is a constant $C_{1}$ such that

$$
\left\|E_{k}^{n} f-E(n k) f\right\| \leqslant C_{1}(n k)^{\circ} K(n k \varphi(k), f: X, D)
$$

for $0<k \leqslant k_{0}, n k \leqslant T$, and $f \in X$;
(c) for arbitrary $T>0$ there is a constant $C_{2}$ such that

$$
\begin{aligned}
\left\|E_{k}^{n} f-E(n k) f\right\| & \leqslant C_{2}(n k)^{a}\|f\|, & & f \in X, \\
& \leqslant C_{2}(n k)^{1-n} \varphi(k)\|f\|_{n}, & & f \in D,
\end{aligned}
$$

for $0<k \leqslant k_{0}, n k \leqslant T$.

Proof. Assuming (a) to hold, let $g \in D$. Using (1.3), (2.1), it follows for $0<k \leqslant k_{0}, n \geqslant 2$, and $n k \leqslant T$ that

$$
\begin{aligned}
\left\|E_{k}^{n} g-E(n k) g\right\| & \leqslant \sum_{j=0}^{n-1}\left\|E_{k}^{n-j-1}\right\|\left\|\left[E_{k}-E(k)\right] E(j k) g\right\| \\
& \leqslant C_{0} k \varphi(k)\|g\|_{D}\left\{1+C k^{-\alpha} \sum_{j=0}^{n-2}(n-j-1)^{-\alpha}\right\} \\
& \leqslant C_{0} k \varphi(k)\|g\|_{D}\left\{1+C k^{-\alpha} \frac{n^{1-\alpha}}{1-\alpha}\right\} \\
& \leqslant C_{0}^{\prime}(n k)^{1-\alpha} \varphi(k)\|g\|_{D}
\end{aligned}
$$

for some constant $C_{0}^{\prime}$ which is independent of $n, k$, and $g$. The case $n=1$ being trivial, property (6) follows by observing that

$$
\begin{aligned}
\left\|E_{k}^{n} f-E(n k) f\right\| \leqslant & \inf _{g \in D}\left\{\left\|\left(E_{k}^{n}-E(n k)\right)(f-g)\right\|+\left\|E_{k}^{n} g-E(n k) g\right\|\right\} \\
\leqslant & \inf _{g \in D}\left\{\left(C e^{K T}+M e^{\omega T}\right)(n k)^{-\alpha}\|f-g\|\right. \\
& \left.+C_{0}^{\prime}(n k)^{1-\alpha} \varphi(k)\|g\|_{D}\right\} \\
\leqslant & C_{1}(n k)^{-\alpha} K(n k \varphi(k), f ; X, D) .
\end{aligned}
$$

The implication (b) $\Rightarrow$ (c) follows from the very definition (2.2). Let (c) be satisfied. Inserting (1.2) into $\left\|E_{k}^{n}-E(n k)\right\| \leqslant C_{2}(n k)^{-\alpha}$ we have

$$
\left\|E_{k}^{n}\right\| \leqslant\left(C_{2}+M e^{\omega T}\right)(n k)^{-\alpha} \quad\left(0<k \leqslant k_{0}, n k \leqslant T\right)
$$

which implies (1.3), that is, (a), and the proof is complete.
It may be noted that in (b) and (c) the estimate on $D$ can be replaced by

$$
\left\|E_{k}^{n} f-E(n k) f\right\| \leqslant C_{1} k \varphi(k)\left\{1+(n k)^{-\alpha}(n-1)\right\}\|f\|_{D}
$$

which is more precise in case $n=1$ (cf. (2.1)).

## 3. Lebesgue Space Case

Let $L_{p}^{N}$ denote the $N$ fold Cartesian product of $L_{p}\left(\mathbb{R}^{d}\right), 1 \leqslant p \leqslant \infty$, with norm

$$
\begin{equation*}
\|f\|_{p}=\sum_{j=1}^{N}\left\|f_{j}\right\|_{p} \quad\left(f=\left(f_{1}, \ldots, f_{N}\right) \in L_{p}^{N}\right) \tag{3.1}
\end{equation*}
$$

where, for an $f_{j} \in L_{p}\left(1^{d}\right)$,

$$
\begin{aligned}
\left\|f_{j}\right\|_{p} & =\left(\int_{i d}\left|f_{j}(x)\right|^{p} d x\right)^{1 / p}, & & 1 \leqslant p<\infty \\
& =\underset{x \in d}{\operatorname{ess} \sup _{x \in}}\left|f_{j}(x)\right|, & & p=\infty
\end{aligned}
$$

By $W_{p, m}^{\lambda}$ we denote the $N$ fold product of Sobolev spaces

$$
W_{p, m_{1}}^{2}=\vdots_{i}^{1} W_{p, m_{j}}\left({ }^{d}\right) .
$$

where $m=\left(m_{1} \ldots . m_{\wedge}\right)$ and $m_{j} \in=\{0,1,2 \ldots\}$ for each $j$, the norms being defined by

$$
\begin{equation*}
\left.|f|_{p, m}=\frac{\vdots}{j} \right\rvert\, f_{i} \|_{p, m}, \quad\left(f=\left(f_{1} \ldots . j_{3}\right) \in W_{p, m}^{\prime}\right) . \tag{3.2}
\end{equation*}
$$

with

$$
\left\|f_{j}\right\|_{r, m_{j}}=\underset{|r|=m_{i}}{\} \|\left. D^{r} f\right|_{\mathrm{i}, n} \quad\left(f_{i} \in W_{n, m_{i}}(\dot{\beta} \cdot d)\right)
$$

We further need the Besov spaces

$$
B_{p}^{s, \cdots}=\left.\right|_{j} ^{1} B_{p}^{\diamond, j}\left(j^{d}\right) \quad\left(s=\left(s_{1} \ldots, s_{i}\right), s_{j}>0\right)
$$

with norms

$$
\begin{array}{ll}
\|f\|_{B f}, \cdots & =\|f\|_{p}+\frac{\vdots}{j} \sup _{1} t \omega_{m i}\left(t, f_{j}\right)_{p}  \tag{3.3}\\
\omega_{m_{i}}\left(r, f_{j}\right)_{p}=\sup _{0<\mid h i=1} \| \frac{\sum_{i}^{m}}{m_{i}}\binom{m_{j}}{l}(-1)^{m_{j}} f_{j}(\cdot+l h) & \left(h \in s_{j}<m_{j}\right)
\end{array}
$$

These are intermediate between $L_{p}^{s}$ and $W_{n, m}^{s}$, that is.

$$
B_{p}^{s \cdot x, v}=\prod_{i=1}^{1}\left(L_{p}\left(\int^{d d}\right), W_{p, m_{i}}\left(i^{d}\right)\right)_{s_{j}, m_{i}, \cdot} \quad\left(0<s_{i}<m_{i}\right) .
$$

cf. |3, Sect. 4.3.1| for details.
The following special case of Theorem 1 can be considered as an extension to $\alpha>0$ of a result of Peetre-Thomée $|10|$, cf. also Brenner-Thomée-Wahlbin | $\mathbf{1}$; Sect. 3.3|.

Theorem 2. Let the initial value problem (1.1) be $\alpha$-well-posed on $L_{p}^{N}$ for some $\alpha \in[0,1)$, and let $\left\{E_{k} ; 0<k \leqslant k_{0}\right\}$ be a difference scheme which is $\alpha$-stable on $L_{p}^{N}$ and consistent with (1.1) of order $\varphi(k)$ on $W_{p, m}^{N}$, for some multi-index $m$.

Given $s=\left(s_{1}, \ldots, s_{N}\right)$ with $0<s_{j}<m_{j}$ and $T>0$, there is a constant $C_{3}$ such that, for each $f \in B_{p}^{s, \infty, N}, 0<k \leqslant k_{0}, n k \leqslant T$, one has

$$
\left\|E_{k}^{n} f-E(n k) f\right\|_{p} \leqslant C_{3} \max _{1 \leqslant j \leqslant N}\left\{(n k)^{\left(s_{j} / m_{j}\right)-\alpha} \varphi(k)^{s_{j} / m_{j}}\right\}\|f\|_{B_{p}^{s, x, k}}
$$

Proof. By Theorem 1 we have for each $f \in L_{p}^{N}$,

$$
\left\|E_{k}^{n} f-E(n k) f\right\|_{p} \leqslant C_{1}(n k)^{-\alpha} K\left(n k \varphi(k), f ; L_{p}^{N}, W_{p, m}^{N}\right)
$$

In view of $[3 ;(4.3 .4)]$ (for $p=\infty$, see also [9]) and (3.1)-(3.3), there is a constant $C_{m}$ which does not depend on $t$, such that

$$
\begin{aligned}
K\left(t, f ; L_{p}^{N}, W_{p, m}^{N}\right) & =\inf _{g_{j} \in W_{p, m_{j}(\mathbb{R}, d)}}\left|\sum_{j=1}^{N}\left\|f_{j}-g_{j}\right\|_{p}+t \sum_{j=1}^{N}\left\|g_{j}\right\|_{p, m_{j}}\right| \\
& =\sum_{j=1}^{N} K\left(t, f_{j} ; L_{p}\left(\mathbb{R}^{d}\right), W_{p, m_{j}}\left(\mathbb{R}^{d}\right)\right) \\
& \leqslant C_{m} \sum_{j=1}^{N}\left[\min (1, t)\left\|f_{j}\right\|_{p}+\omega_{m_{j}}\left(t^{1 / m_{j}}, f_{j}\right)_{p} \mid\right. \\
& \leqslant C_{m} \sum_{j=1}^{N}\left[\min (1, t)+t^{s_{j} / m_{j}} \mid\|f\|_{B p_{p} \cdot x, N}\right. \\
& \left.\leqslant N C_{m} \max _{1 \leqslant j \leqslant N} \mid \min (1, t)+t^{s_{j} / m_{j}}\right]\|f\|_{B s, \alpha, v} \\
& \leqslant 2 N C_{m} \max _{1 \leqslant j \leqslant N} t^{s_{j} / m_{j}}\|f\|_{B_{p}^{s, \alpha, v}} \quad(t>0) .
\end{aligned}
$$

Setting $t=n k \varphi(k)$ the assertion follows.
We finally note that Theorem 2 might also be written as an equivalence theorem if one adds the case $s_{j}=0$, where $\|f\|_{B \xi, \alpha, x}$ has to be replaced by $\|f\|_{p}$.
