

## Preface

The present volume is the first of three dedicated to the memory of Géza Freud.

It is my great pleasure to thank the Editor of this Journal, Oved Shisha, for making it available for such a tribute to Freud, a project I have accomplished with the enthusiastic collaboration of my friends and fellow Associate Editors Ranko Bojanic and Vili Totik. I also want to express my genuine appreciation to Hans-Peter Blatt, Ronald DeVore, Tord Ganelius, Jean-Pierre Kahane, László Leindler, Hrushikesh Mhaskar, Vasil Popov, and József Szabados for their kind cooperation which resulted in their survey papers published here. My friend Alphonse Magnus solved one of Freud's conjectures specifically at my request so that I could include the solution in these memorial volumes. For this Alphonse deserves my very special gratitude. I am equally grateful to Zeev Ditzian and Vili Totik for their paper providing snapshots of their research reaching far beyond Freud's results on weighted approximations. I also thank all those mathematicians who submitted papers for these volumes including those whose papers could not be accepted for publication for one reason or another.

Finally, I thank Géza Freud for having been such a wonderful friend to me for almost ten years. It was a magnificent experience for me to spend twenty-one months of hard labor organizing this collective effort by so many of us, though I would have much preferred it if the need for such a memorial arose only in the year 2042 after Freud had lived one hundred and twenty years.

PAUL NEVAI
