#### Abstract

Two new monoterpenoid glycosides, $\alpha-(E)$-acaridiol 8-O- $\beta$-D-glucopyranoside (1) and $\alpha-(E)$-acaridiol $9-O-\beta$-D-glucopyranoside (2), as well as a new thiophen, 2-acetyl-3-hydroxy-5-(prop-1-ynyl)thiophen 3-O- $\beta$-D-glucopyranoside (3), were isolated from the roots of Eupatorium chinense. Their structures were determined on the basis of extensive spectroscopic and chemical analyses.

Keywords: Eupatorium chinense; monoterpenoid glycoside; thiophen

## 1. Introduction

The plants of genus Eupatorium (Compositae) are mainly spread in the temperate areas of USA and East Asia. Previous phytochemical investigation revealed that the main constituents in the plants of this genus were sesquiterpene lactones [1-5], triterpenoids [6,7], flavonoids [5,6], benzofurans [7,8], and lignans [7]. The dried root of Eupatorium chinense had been widely used as a Chinese folk medicine for the treatment of multifarious throat disorders for a long time. The potential medicinal importance of E. chinense prompted us to initiate a phytochemical study on the roots of this plant, which led to the isolation of two new monoterpenoid glycosides, $\alpha-(E)$-acaridiol $8-O-\beta-\mathrm{D}-\mathrm{glu}-$ copyranoside (1) and, $\alpha-(E)$-acaridiol 9- $O$ -$\beta$-D-glucopyranoside (2), and a new thiophen, 2-acetyl-3-hydroxy-5-(prop-1ynyl)thiophen 3-O- $\beta-\mathrm{D}-$ glucopyranoside (3), along with five known compounds
(4-8) (Figure 1). In this paper, the isolation and structural elucidation of the two new isomeric monoterpenoid glycosides and the new thiophen are described.

## 2. Results and discussion

Compound 1 was obtained as a colorless gum. The molecular formula of $\mathbf{1}$ was established as $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{O}_{7}$ by HR-ESI-MS at $m / z 355.1730[\mathrm{M}+\mathrm{Na}]^{+}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1}$ showed signals for two vinyl protons [ $\delta_{\mathrm{H}} 5.63$ and 5.12 (each $\left.1 \mathrm{H}, \mathrm{m}\right)$ ], two oxo-methylenes [ $\delta_{\mathrm{H}} 4.40(1 \mathrm{H}, \mathrm{m})$, $4.29(1 \mathrm{H}, \mathrm{m})$ and $4.00(2 \mathrm{H}, \mathrm{br} \mathrm{s})$ ], two methylenes [ $\delta_{\mathrm{H}} 2.14(2 \mathrm{H}, \mathrm{m})$ and $2.10(2 \mathrm{H}$, m )], two methyls [ $\delta_{\mathrm{H}} 1.67$ and 1.60 (each $3 \mathrm{H}, \mathrm{s})$ ], and an anomeric proton [ $\delta 4.28$ $(1 \mathrm{H}, \mathrm{d}, J=7.8 \mathrm{~Hz})]$. The ${ }^{13} \mathrm{C}$ NMR and DEPT spectra of 1 exhibited 16 carbon signals including 4 olefinic carbons, 4 methylenes, 2 methyls and a sugar unit. With the aid of ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, HSQC , HMBC, and NOESY experiments, the

$2 \mathrm{R}_{1}=\mathrm{H}, \mathrm{R}_{2}=\mathrm{Glc}$

3

Figure 1. Chemical structures of compounds 1-8.

NMR signals of $\mathbf{1}$ were assigned as shown in Table 1.

The above ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals of the aglycone and sugar unit of $\mathbf{1}$ were similar to those of the known compound $\alpha$ -(E)-acaridiol [9] and glucopyranosyl [10].

The HMBC correlations between the proton at $\delta_{\mathrm{H}} 5.12(\mathrm{H}-3)$ and the carbons at $\delta_{\mathrm{C}} 25.9(\mathrm{C}-1) / 17.8(\mathrm{C}-10)$, and between the proton at $\delta_{\mathrm{H}} 5.63(\mathrm{H}-7)$ and the carbons at $\delta_{\mathrm{C}} 29.2$ (C-5)/66.3 (C-9), confirmed the planar structure of the aglycone of $\mathbf{1}$

Table 1. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectral data of compounds $\mathbf{1}$ and $\mathbf{2}\left(\mathrm{CD}_{3} \mathrm{OD}, \delta \text { in ppm, } J \text { in } \mathrm{Hz}\right)^{\mathrm{a}}$.

Figure 2. Key HMBC $(\rightarrow)$ and NOESY $(\leftrightarrow)$ correlations of $\mathbf{1}-\mathbf{3}$.
(Figure 2). The NOESY correlation between $\mathrm{H}-5$ at $\delta_{\mathrm{H}} 2.14$ and $\mathrm{H}-8 \mathrm{a}$ at $\delta_{\mathrm{H}}$ 4.40 suggested that the geometry of the double bond was $E$ form. Furthermore, the HMBC correlation between $\mathrm{H}-8 \mathrm{a}$ at $\delta_{\mathrm{H}}$ 4.40 and $\mathrm{C}-1^{\prime}$ at $\delta_{\mathrm{C}} 103.1$ indicated that the glucopyranosyl unit was located at C-8. Thus, the structure of $\mathbf{1}$ was elucidated as $\alpha-(E)$-acaridiol 8-O- $\beta$-d-glucopyranoside.

Compound 2 was obtained as a colorless gum. Compound $\mathbf{2}$ showed the same molecular formula as $\mathbf{1}$ by its HR-ESI-MS. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectral data (Table 1) of $\mathbf{2}$ were also very similar to those of $\mathbf{1}$, except that the $\mathrm{C}-9$ resonance in 2 exhibited a comparative downfield shift, whereas the C-8 resonance displayed somewhat upfield shift. Analysis of the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, HSQC, HMBC, and NOESY spectral data of $\mathbf{1}$ and $\mathbf{2}$ led to the conclusion that the two compounds were isomers due to the different location of the sugar unit. The HMBC correlation between $\mathrm{H}-9 \mathrm{~b}$ at $\delta_{\mathrm{H}} 4.08$ and $\mathrm{C}-1^{\prime}$ at $\delta_{\mathrm{C}}$ 103.1 suggested that the monosaccharide moiety was located at C-9. The NOESY correlation between $\mathrm{H}-5$ at $\delta_{\mathrm{H}} 2.14$ and $\mathrm{H}-$ 8 at $\delta_{\mathrm{H}} 4.13$ confirmed that the geometry of the double bond was also $E$ form. Thus, the structure of 2 was elucidated as $\alpha-(E)$ acaridiol 9-O- $\beta$-D-glucopyranoside.

Compound 3 was obtained as an amorphous powder. The quasi-molecular ion at $m / z 365.0665[\mathrm{M}+\mathrm{Na}]^{+}$in its HR-

ESI-MS indicated that the molecular formula of $\mathbf{3}$ was $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{O}_{7} \mathrm{~S}$. The IR spectrum of $\mathbf{3}$ suggested the presence of hydroxyl group ( $3299 \mathrm{~cm}^{-1}$ ), acetylenic bond ( $2234 \mathrm{~cm}^{-1}$ ), and carbonyl group $\left(1624 \mathrm{~cm}^{-1}\right)$. The UV spectrum showed absorption maxima at 226 and 316 nm . The above data suggested that $\mathbf{3}$ may be a thiophen. The ${ }^{1} \mathrm{H}$ NMR spectral data of $\mathbf{3}$ showed the presence of an olefinic proton [ $\delta_{\mathrm{H}} 7.08(1 \mathrm{H}, \mathrm{s})$ ], two methyls $\left[\delta_{\mathrm{H}} 2.56\right.$ and 2.07 (each $3 \mathrm{H}, \mathrm{s})$ ], and an anomeric proton $\left[\delta_{\mathrm{H}} 5.01(1 \mathrm{H}, \mathrm{d}, J=7.4 \mathrm{~Hz})\right]$. The ${ }^{13} \mathrm{C}$ NMR and DEPT spectra of $\mathbf{3}$ showed 15 carbon signals including a carbonyl, 4 olefinic carbons, 2 methyls, and a sugar unit. Acid hydrolysis of $\mathbf{3}$ suggested the presence of D-glucopyranosyl residue. The HMBC correlations between $\mathrm{H}-10$ at $\delta_{\mathrm{H}}$ 2.56 and $\mathrm{C}-2$ at $\delta_{\mathrm{C}} 125.1$, between $\mathrm{H}-1^{\prime}$ at $\delta_{\mathrm{H}} 5.01$ and $\mathrm{C}-3$ at $\delta_{\mathrm{C}} 158.4$, as well as between $\mathrm{H}-8$ at $\delta_{\mathrm{H}} 2.07$ and $\mathrm{C}-5$ at $\delta_{\mathrm{C}}$ 131.9 indicated that the acetyl, glucopyranosyl unit and prop-1-ynyl group were connected to $\mathrm{C}-2, \mathrm{C}-3$, and $\mathrm{C}-5$ positions, respectively. Thus, the structure of $\mathbf{3}$ was characterized as 2-acetyl-3-hydroxy-5-(prop-1-ynyl)thiophen 3-O- $\beta$-D-glucopyranoside.

Other known compounds were identified as pungenin (4) [10], 2,6-dimethoxy-4-hydroxyphenol- $O$ - $\beta$-D-glucoside (5) [11], syringic acid 4-O- $\beta$-d-glucopyranoside (6) [12], di- $O$-methylcrenatin (7) [11],
and benzyl-1-O- $\beta$-D-glucopyranoside (8) [13], by comparison of their physical and spectroscopic data with those reported previously.

## 3. Experimental

### 3.1 General experimental procedures

Melting points were measured on an X-5 micro melting point apparatus (Beijing Tech Instrument, Inc., Beijing, China). UV spectra were obtained on a Jasco V-550 UV/Vis spectrometer. IR spectra were obtained on a Jasco FT/IR-480 plus infrared spectrometer with KBr pellets. Optical rotations were determined on a Jasco P-1020 polarimeter. 1D and 2D NMR spectra were measured using a Bruker AV-400 spectrometer. HR-ESIMS data were detected on an Agilent 6210 ESI/TOF mass spectrometer. Column chromatography (CC) was carried out on silica gel (200-300 mesh; Qingdao Marine Chemical, Inc., Qingdao, China), ODS (YMC, Kyoto, Japan), and Sephadex LH-20 (Pharmacia, NJ, USA), respectively. Preparative high-performance liquid chromatography (HPLC) was carried out on a Varian chromatograph equipped with a Prostar 215 pump, a Prostar 325 UV-vis detector, and a Cosmosil $5 \mathrm{C}_{18}$-MS-II reversed-phase column ( $20 \mathrm{~mm} \times 250 \mathrm{~mm}, 5.0 \mu \mathrm{~m}$, Nacalai Tesque, Kyoto, Japan). Analytical HPLC was carried out on a Dionex chromatograph equipped with a P680 pump, a PDA100 photodiode array detector, and a Cosmosil $5 \mathrm{C}_{18}$-MS-II reversed-phase column ( $4.6 \mathrm{~mm} \times 250 \mathrm{~mm}, 5.0 \mu \mathrm{~m}$, Nacalai Tesque). Chiral separation was carried out on an Agilent 1200 system equipped with a G1315B DAD detector and a chiral CD-Ph column ( $4.6 \mathrm{~mm} \times 250 \mathrm{~mm}, 5.0 \mu \mathrm{~m}$, Shiseido Fine Chemicals Ltd, Tokyo, Japan).

### 3.2 Plant material

The roots of $E$. chinense were collected in Conghua city, Guangdong Province of

China, in October of 2006, and authenticated by Prof. Shu-Yuan Li (Guangdong Pharmaceutical University). A voucher specimen (No. 2006101601) is deposited in the Institute of Traditional Chinese Medicine \& Natural Products, Jinan University, Guangzhou, China.

### 3.3 Extraction and isolation

The dried and powdered roots of $E$. chinense ( 10 kg ) were extracted with $70 \%$ (v/v) $\mathrm{EtOH}-\mathrm{H}_{2} \mathrm{O}(3 \times 30 \mathrm{~L}$, each 2 h$)$ under reflux. The concentrated EtOH extract was suspended in $\mathrm{H}_{2} \mathrm{O}$ (4L) and then successively extracted with petroleum ether $(4 \times 4 \mathrm{~L})$, $\mathrm{EtOAc}(4 \times 4 \mathrm{~L})$, and $n$ $\mathrm{BuOH}(4 \times 4 \mathrm{~L})$. The $n-\mathrm{BuOH}$ solution was concentrated to give a residue ( 180 g ), which was subjected to silica gel column eluting with $\mathrm{CHCl}_{3}-\mathrm{MeOH}$ (100:0 $\rightarrow 0: 100$ ) to afford seven fractions (Fr. A-G). Fr. C ( 3 g ) was further purified using ODS column eluting with $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(50: 50 \rightarrow 90: 10)$ to give five fractions (Fr. C1-C5). Fr. C1 (183 mg) was subjected to preparative HPLC ( $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 10: 90$; flow rate, $8 \mathrm{ml} / \mathrm{min}$; wavelength, 210 nm ) to yield $\mathbf{4}(4 \mathrm{mg}), 5$ $(17 \mathrm{mg})$, and $7(16 \mathrm{mg})$. Fr. C2 ( 50 mg ) was subjected to preparative HPLC (MeOH$\mathrm{H}_{2} \mathrm{O}, 25: 75$; flow rate, $8 \mathrm{ml} / \mathrm{min}$; wavelength, 210 nm ) to obtain $\mathbf{8}(4 \mathrm{mg})$. Fr. C3 ( 246 mg ) was separated by preparative HPLC $\left(\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 40: 60\right.$; flow rate, $8 \mathrm{ml} / \mathrm{min}$; wavelength, 210 nm ) to yield 3 $(12 \mathrm{mg}), \mathbf{6}(7 \mathrm{mg})$, and a mixture of $\mathbf{1}$ and $\mathbf{2}$ $(10 \mathrm{mg})$. The mixture was further separated into isomers $\mathbf{1}\left(0.5 \mathrm{mg}, t_{\mathrm{R}} 23.9 \mathrm{~min}\right)$ and $\mathbf{2}$ $\left(0.3 \mathrm{mg}, t_{\mathrm{R}} 26.5 \mathrm{~min}\right)$ by chiral column chromatography ( $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 20: 80$; column temperature, $30^{\circ} \mathrm{C}$; flow rate, $0.8 \mathrm{ml} / \mathrm{min}$; wavelength, 210 nm ).

### 3.3.1 $\alpha$-(E)-Acaridiol 8-O- $\beta$-Dglucopyranoside (1)

A colorless gum, IR $\nu_{\max }^{\mathrm{KBr}}: 3412,3020$, 2961, 1673, 1102, 1060, $810 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$

NMR ( $\left.\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}\right)$ and ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}, 100 \mathrm{MHz}\right)$ spectral data, see Table 1; HR-ESI-MS $\mathrm{m} / \mathrm{z} 355.1730$ $[\mathrm{M}+\mathrm{Na}]^{+}$(calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{O}_{7} \mathrm{Na}$, 355.1727).

### 3.3.2 $\alpha$-(E)-Acaridiol 9-O- $\beta$-Dglucopyranoside (2)

A colorless gum, IR $\nu_{\max }^{\mathrm{KBr}}: 3413,3019$, 2961, 1673, 1107, 1062, $811 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}\right)$ and ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}, 100 \mathrm{MHz}\right)$ spectral data, see Table 1; HR-ESI-MS $\mathrm{m} / \mathrm{z} 355.1731$ $[\mathrm{M}+\mathrm{Na}]^{+}$(calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{O}_{7} \mathrm{Na}$, 355.1727).

### 3.3.3 2-Acetyl-3-hydroxy-5-(prop-1ynyl)thiophen 3-O- $\beta$-D-glucopyranoside (3)

An amorphous powder, mp $118-119^{\circ} \mathrm{C}$; $[\alpha]_{\mathrm{D}}^{25}-37.8\left(c 0.7, \mathrm{CH}_{3} \mathrm{OH}\right) ; \mathrm{UV}(\mathrm{MeOH})$ $\lambda_{\max }(\log \varepsilon) 226$ (4.11), 316 (4.50) nm; IR $(\mathrm{KBr}) \nu_{\max } 3299,2234,1624,1454,1100$, 1080, $1041 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}\right.$, $400 \mathrm{MHz}) \delta: 7.08(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-4), 5.01(1 \mathrm{H}$, $\left.\mathrm{d}, \quad J=7.4 \mathrm{~Hz}, \mathrm{H}-1^{\prime}\right), 3.88(1 \mathrm{H}, \mathrm{dd}$, $\left.J=12.1,2.0 \mathrm{~Hz}, \mathrm{H}^{\prime} 6^{\prime} \mathrm{a}\right), 3.69(1 \mathrm{H}, \mathrm{dd}$, $\left.J=12.1,5.6 \mathrm{~Hz}, \mathrm{H}-6^{\prime} \mathrm{b}\right), 3.47(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-$ $\left.2^{\prime}\right), 3.46\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3^{\prime}\right), 3.43\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-5^{\prime}\right)$, 3.39 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-4^{\prime}$ ), 2.56 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}-10$ ), 2.07 (3H, s, H-8); ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{CD}_{3} \mathrm{OD}$, $100 \mathrm{MHz}) \delta: 192.6(\mathrm{C}-9), 158.4(\mathrm{C}-3)$, 131.9 (C-5), 125.1 (C-2), 123.7 (C-4), 96.0 (C-7), 73.7 (C-6), 29.8 (C-10), 4.2 (C-8), 103.5 (C-1'), 78.5 (C-5'), 78.1 (C-3'), 74.8 (C-2'), 71.1 (C-4'), 62.3 (C-6'); HR-ESIMS $\mathrm{m} / \mathrm{z} 365.0665[\mathrm{M}+\mathrm{Na}]^{+}$(calcd for $\left.\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{O}_{7} \mathrm{SNa}, 365.0665\right)$.

### 3.4 Acid hydrolysis and gas chromatographic analysis of 3

Compound 3 ( 2 mg ) was hydrolyzed with 2 M HCl for 4 h at $80^{\circ} \mathrm{C}$. The reaction mixture was evaporated under vacuum to yield a residue, which was then dissolved in $\mathrm{H}_{2} \mathrm{O}$ and extracted with $\mathrm{CHCl}_{3}$. The
aqueous layer was concentrated and dried by $\mathrm{N}_{2}$, and treated with dry pyridine ( 1 ml ) and L-cysteine methyl ester hydrochloride $(2 \mathrm{mg})$, followed by heating at $60^{\circ} \mathrm{C}$ for 2 h , and then concentrated to dryness with $\mathrm{N}_{2}$. The residue was added to N (trimethylsilyl)imidazole ( 0.2 ml ) and kept at $60^{\circ} \mathrm{C}$ for 1 h . Then, the solution was diluted with $\mathrm{H}_{2} \mathrm{O}(1 \mathrm{ml})$ and extracted with cyclohexane ( $3 \times 1 \mathrm{ml}$ ). The supernatant was concentrated to 1 ml , then subjected to GC analysis [column: AT-SE$30(0.5 \mu \mathrm{~m} \times 0.32 \mathrm{~mm} \times 30 \mathrm{~m})$, detector: FID, column temperature: $220^{\circ} \mathrm{C}$, detector temperature: $270^{\circ} \mathrm{C}$, injector temperature: $270^{\circ} \mathrm{C}$, and carried gas: $\mathrm{N}_{2}$. A peak of the derivative of $\mathbf{3}$ was observed at $t_{\mathrm{R}}$ 28.78 min (D-Glc), whereas the peaks of the standard monosaccharide derivatives were recorded at 28.76 (D-Glc) and 30.22 (L-Glc), respectively.
