

## Letter to the Editor

### **<sup>1</sup>H, <sup>13</sup>C and <sup>15</sup>N resonance assignments of the 2'-5' RNA ligase-like protein from *Pyrococcus furiosus***

DOI 10.1007/s10858-005-5581-8

We have been working on RNA metabolism in the *Pyrococcus furiosus* and isolated several RNA-binding proteins by expression cloning method (Kanai et al., 2003). In the present study, NMR analysis of a protein PF0027 (184 residues), which was cloned as a protein changing the gel mobility of RNase T1 digested oligoribonucleotides, was performed (to be published elsewhere). Based on the sequence homology, we hereafter call PF0027 as a 2'-5' RNA ligase-like protein. Using the standard triple-resonance assignment methodology, backbone assignments could be made for almost all residues (except for <sup>15</sup>N of Ile<sup>100</sup>, <sup>15</sup>N and <sup>13</sup>C<sub>α</sub> of Ser<sup>10</sup>, <sup>13</sup>CO of Arg<sup>2</sup>, Gly<sup>79</sup> and Ile<sup>100</sup>). The side chain assignments were assessed to be complete with the exception of overlapped regions. BMRB deposits with the Accession No. 10004.
