# Novel Synthesis of 5-Amino-1-arylsulfonyl-4-pyrazolin-3-ones as a New Class of $\boldsymbol{N}$-Sulfonylated Pyrazoles $\dagger$ <br> Galal H. Elgemeie ${ }^{* a}$ and Nadia H. Metwallyb <br> ${ }^{a}$ Chemistry Department, Faculty of Science, Helwan University, Helwan, Cairo, Egypt <br> ${ }^{b}$ Chemistry Department, Faculty of Science, Cairo University, Giza, Egypt 

A novel synthesis of 5-amino-1-arylsulfonyl-4-pyrazolin-3-ones via intramolecular cyclization of cyanoaceto-$N$-arylsulfonylhydrazides is reported and the synthetic potential of the method is demonstrated.

Recent reports from our laboratory and others have demonstrated the effectiveness of a variety of $N$-sulfonylated heterocycles and other antimetabolites as antiplastic agents in a number of experimental murine tumor systems. ${ }^{1-5}$ These compounds have been shown to cause inhibition of thymidine and uridine incorporation into DNA and RNA and appear to constitute a new class of antimetabolites. It was of interest to study their stereostructure and evaluate the effects of various structural modifications on biological activity. Recently, $N$-carboxyamidated pyrazoles were prepared in low yields from cyanoaceto- $N$-arylaminohydrazides. ${ }^{6}$ The present investigation reports a new, one-step synthesis of $N$-sulfonylated pyrazoles via intramolecular cyclization of cyanoacetoN -arylsulfonylhydrazides.

Thus, it has been found that cyanoacetohydrazide $\mathbf{1}$ reacts with arylsulfonyl chloride in ethanol to afford the corresponding cyanoaceto- $N$-arylsulfonylhydrazides $\mathbf{2}$ in good yields. The structures of $\mathbf{2}$ were established and confirmed on the basis of their elemental analysis and spectral data (mass, IR, ${ }^{1} \mathrm{H} N M R$ ). The analytical data for $\mathbf{2 a}$ revealed a molecular formula $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}\left(\mathrm{M}^{+}, m / z\right.$ 239), ${ }^{1} \mathrm{H}$ NMR spectroscopy was used to confirm this structure. Thus, a band at $\delta 3.63$ was assignable to the $\mathrm{CH}_{2}$ group, a multiplet at $\delta 7.56-7.86$ to aromatic protons and two broad singlets at $\delta 10.11$ and 10.40 to two NH groups ( $\mathrm{D}_{2} \mathrm{O}$ exchangeable).

[^0]Compounds 2 on refluxing in ethanol containing catalytic amounts of piperidine undergo intramolecular cyclization to give the 5-amino-1-arylsulfonyl-4-pyrazolin-3-ones 4 or the tautomeric 5-amino-1-arylsulfonyl-3-hydroxypyrazole structures 5. The hydroxy form 5 would be expected to be more stable, because of the weakened basicity of the ring nitrogen at the 2 position, in turn arising from the adjacent heteroatom and the oxygen at the 3 position, however spectral studies indicated the presence of the NH tautomer in solution for all products, thus, the ${ }^{13} \mathrm{CNMR}$ for $\mathbf{4 a}$ revealed a signal at $\delta 170.81$ assigned to a carbonyl carbon atom, and its ${ }^{1} \mathrm{H}$ NMR revealed a broad singlet at $\delta 10.00$ assigned to an NH group ( $\mathrm{D}_{2} \mathrm{O}$ exchangeable). No significant amounts of the alternative tautomer 5 could be detected in solution.

## Experimental

Melting points were uncorrected. IR spectra were obtained ( KBr disc) on a Pye Unicam Spectra-1000 spectrophotometer, ${ }^{1} \mathrm{H}$ and ${ }^{13}$ C NMR spectra on Wilmad 270 MHz or Varian 400 MHz spectrometers for solutions in DMSO- $\mathrm{d}_{6}$ using $\mathrm{SiMe}_{4}$ as internal standard and mass spectra on a Varian MAT 112 spectrometer. Analytical data were obtained from the Microanalytical Data Center at Cairo University.
General Procedure for Arylsulfonylcyanoacetohydrazides 2a-f.-A mixture of cyanoacetohydrazide $\mathbf{1}(0.01 \mathrm{~mol})$ and arylsulfonyl chloride ( 0.01 mol ) in ethanol ( 30 ml ) was stirred at room temperature for 24 h . The resulting solid product was filtered off and crystallized from EtOH.
