Foreword

This volume is dedicated to Professor J.F.K. Huber, who passed away in August 2000. An obituary was published in this journal last year [1], and in acknowledgement of his great influence on many of his colleagues, friends and co-workers, we are pleased to have the opportunity here to present a number of dedicated contributions bundled in the form of a special volume of the *Journal of Chromatography A*. We all benefited from his fundamental concepts of separation methods and were impressed by his deep insight into so many aspects of analytical chemistry. The present collection of papers is meant as a personal tribute to not only one of the most

influential persons in separation science, who had a great impact on us, but also a warm hearted man.
