# 3,9,9-Tribromocamphor 

By David F. Rendle and James Trotter<br>Department of Chemistry, University of British Columbia, 2075 Wesbrook Place, Vancouver, British Columbia, Canada V6T 1W5

(Received 28 April 1975; accepted 27 May 1975)

Abstract. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{Br}_{3} \mathrm{O}$, monoclinic, $P 2_{1}, a=8.949$ (5), $b=7.712$ (7), $c=8.996$ (9) $\AA, \beta=93.33$ (5) ${ }^{\circ}, Z=2, D_{x}=$ $2.08 \mathrm{~g} \mathrm{~cm}^{-3}, \mu(\mathrm{Mo} K \alpha)=102.8 \mathrm{~cm}^{-1}$. The norbornane skeleton is undistorted, with close to normal bond lengths and angles. The $\mathrm{C}-\mathrm{C}-\mathrm{C}$ bridge angle is $95^{\circ}$. The molecules are linked by $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds in the solid state.

Introduction. The colourless crystals were small and poorly formed. Unit-cell and intensity data were measured on a Datex-automated G. E. XRD 6 diffractometer with Mo $K \alpha$ radiation and the $\theta-2 \theta$ scan technique. A standard reflexion monitored periodically throughout data collection decreased in intensity by $40 \%$ and the data were accordingly scaled. Of 1181 independent reflexions with $2 \theta \leq 50^{\circ}$, 507 had intensities greater than $2 \sigma$ above background $\left[\sigma^{2}(I)=S+B+\right.$ $(0.09 S)^{2}$, where $S=$ scan and $B=$ background count]. Absorption corrections were not made in view of the irregular crystal surface. The structure was solved by Patterson and Fourier syntheses. Refinement was by full-matrix least-squares techniques in which the function minimized was $\sum w\left(F_{o}-F_{c}\right)^{2}$ with weights $w$ derived from counting statistics. The scattering factors for
bromine were corrected for the real and imaginary parts of anomalous dispersion, and each bromine was refined with anisotropic thermal parameters. An attempt to refine all atoms with anisotropic thermal parameters resulted in non-positive-definite tensors for two of the carbon atoms and so the light atoms were refined with isotropic thermal parameters. Hydrogen atoms were included in the structure-factor calculations with fixed positional and thermal parameters. The correct absolute configuration has been determined (it is in any case determined from the chemical preparation), and the final $R$ and $R^{\prime}\left(=\left[\sum w\left(\left|F_{o}\right|-\left|F_{c}\right|\right)^{2} / \sum w\left|F_{o}\right|^{2}\right]^{1 / 2}\right)$ for the 507 reflexions with $I \geq 2 \sigma(I)$ are 0.066 and 0.076 [the opposite enantiomorph has $R=0.067$ and $R^{\prime}=$ 0.078 , and hence may be rejected at the $0.5 \%$ significance level (Hamilton, 1965)]. Three low-angle reflexions 020,040 , and 021 were given zero weight in the last two cycles of refinement because of suspected extinction effects. For all 1181 data $R$ was 0.148 and $R^{\prime} 0.088$.*

* A list of structure factors has been deposited with the British Library Lending Division as Supplementary Publication No. SUP 31169 ( 12 pp., 1 microfiche). Copies may be obtained through The Executive Secretary, International Union of Crystallography, 13 White Friars, Chester CH1 1NZ, England.

The error in an observation of unit weight $\left(\left[\sum w\left(\left|F_{o}\right|-\left|F_{c}\right|\right)^{2} /(m-n)\right]^{1 / 2}\right)$ was $0 \cdot 92$, which suggests that the 0.09 factor in the expression for the variance is too high. Final positional and thermal parameters are listed in Table 1, and bond lengths and valency angles in Table 2.

Discussion. The crystal structure analysis was undertaken to assist in the characterization of a by-product in the preparation of 3,9-dibromocamphor (Cachia, Darby, Eck \& Money, 1975). The byproduct has been confirmed as 3,9,9-tribromocamphor.

Fig. 1 is a stereo diagram of the molecule (hydrogen atoms omitted) in the correct absolute configuration. The presence of three bromine atoms appears to cause little distortion in the norbornane skeleton. The sixmembered ring is a fairly symmetrical boat with atoms $\mathrm{C}(1)$ and $\mathrm{C}(4)$ displaced 0.80 (3) and 0.95 (3) $\AA$ above the best plane through atoms $C(2), C(3), C(5)$, and $\mathrm{C}(6)$. The bridgehead angle is $95(2)^{\circ}$ and the remainder

Fig. 2. Stereo diagram of the contents of the unit cell.
of the endocyclic valency angles follow the same trend as those in ( + )-8-bromocamphor (Bear \& Trotter, 1975a) rather than, for example, those in (-)-3,3,4-trimethyl-1,7-dibromonorbornan-2-one, a structure with a slightly twisted norbornane skeleton (Bear \& Trotter, 1975b). The accuracy with which the positions of the carbon atoms are known is low and hence subtle differences in $\mathrm{C}-\mathrm{C}$ bond lengths may be hidden. The $\mathrm{C}\left(s p^{3}\right)-\mathrm{C}\left(s p^{2}\right)$ distances $\mathrm{C}(1)-\mathrm{C}(2)$ and $\mathrm{C}(2)-\mathrm{C}(3)$ are 1.52 (4) and 1.49 (4) $\AA$. The angles between the $C(1)$, $C(4), C(7)$ plane and the four-atom planes of the sixmembered boat $[\mathrm{C}(1), \mathrm{C}(2), \mathrm{C}(3), \mathrm{C}(4)$, and $\mathrm{C}(1), \mathrm{C}(4)$, $C(5), C(6)$ ] are $127 \cdot 6$ and $124 \cdot 0^{\circ}$, comparing reasonably well with the corresponding dihedral angles of $124 \cdot 5$ and $124 \cdot 2^{\circ}$ in (+)-8-bromocamphor. The $\mathrm{C}-\mathrm{Br}$ distances average 1.95 (1) $\AA$.

Fig. 2 is a stereo diagram of the contents of the unit cell. The molecules are linked into infinite chains about the twofold screw axes by $\mathrm{C}(3)-\mathrm{H} \cdots \mathrm{O}$ interactions (broken line in Fig. 2), which may represent hydrogen bonds. $\operatorname{Br}(3)$, by way of the inductive effect, presumably causes $\mathrm{H}(3)$ to be quite acidic. The $\mathrm{C}(3) \cdots \mathrm{O}$ distance is $3.29 \AA$; with $\mathrm{H}(3)$ in its calculated position,
the $\mathrm{H} \cdots \mathrm{O}$ distance is about $2 \cdot 3 \AA$, and the $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ angle is about $160^{\circ}$. These parameters are in agreement with those in other documented $\mathrm{C}-\mathrm{H} \ldots \mathrm{O}$ hydrogen bonds e.g. O $\cdots$ H $2.27 \AA$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O} 164^{\circ}$ in 1-(4-chlorobenzyl)-1-nitroso-2-(4,5-dihydro-2-imidazolyl)hydrazine monohydrate (Palenik, 1965). The intramolecular nonbonded $\operatorname{Br}(1) \cdots \operatorname{Br}(2)$ distance is $3 \cdot 156$ (7) $\AA$, and the only other intermolecular contacts of $<3 \cdot 5 \AA$ are $\mathrm{O} \cdots \operatorname{Br}(2)[1+x, y, z] 3 \cdot 33(2) \AA$ and $\mathrm{O} \cdots \mathrm{C}$ (8) $\left[1-x, y-\frac{1}{2},-z\right] 3 \cdot 48$ (4) $\AA$.

We thank Mr K. Bidulock and Dr T. Money for the crystals, the National Research Council of Canada for financial support and the University of British Columbia Computing Centre for assistance.

#### Abstract

C}_{49} \mathrm{H}_{33} \mathrm{~N}_{5} \mathrm{CoCl} \cdot \frac{1}{2}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\), monoclinic, $P 2_{1} / n$, $a=14 \cdot 50$ (4), $b=23 \cdot 42(6), c=13 \cdot 12$ (3) $\AA, \beta=102 \cdot 1$ (3) ${ }^{\circ}$, $V=4357$ (19) $\AA^{3} ; D_{x}=1 \cdot 258 \mathrm{~g} \mathrm{~cm}^{-3} . R=7 \cdot 3 \%, 3997$ observed reflexions. The cobalt atom is in the plane of the four pyrrole nitrogen atoms and has nearly exact octahedral coordination. The porphinato core is considerably ruffled. The overall symmetry of the tetraphenyl porphinato group is $\overline{4}$.

Introduction. Several six-coordinate cobalt(III) complexes of $\alpha, \beta, \gamma, \delta$-tetraphenylporphyrin (TPP) have been prepared in our Institute (Yamamoto \& Tonomura, 1964). The effects of axial ligands on the complexes were studied by electronic absorption and nuclear magnetic resonance spectra. The title compound [C1TPP.PyCo ${ }^{\text {III }}$ ] was chosen to determine the threedimensional structure. The complex was obtained by heating $\mathrm{Co}^{\text {II }} \mathrm{TPP}$ with pyridine in a hydrochloric acidic benzene-methanol mixture. The violet metallic-lustrous prismatic crystals were identified by elemental analysis. Found: C $75 \cdot 80, \mathrm{H} 4 \cdot 28, \mathrm{~N} 8 \cdot 56$, Co $7 \cdot 18, \mathrm{Cl}$ $4 \cdot 25 \%$. Calculated: C $75 \cdot 71, \mathrm{H} 4 \cdot 36$, N $8 \cdot 49$, Co $7 \cdot 14$, $\mathrm{Cl} 4 \cdot 30 \%$, for $\mathrm{C}_{52} \mathrm{H}_{36} \mathrm{~N}_{5} \mathrm{CoCl}$ [ClTPP.PyCo. $\frac{1}{2}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)$ ].

Fig. 1. The numbering scheme for the atoms used in this paper. The numerals attached to the atoms in the porphinato core represent perpendicular displacements from the mean plane in units of $0 \cdot 1 \AA$.
