#### Abstract

C}_{26} \mathrm{H}_{26} \mathrm{P}_{3} \mathrm{AuF}_{6}\), monoclinic, $C 2 / c ; a=23 \cdot 23$ (2), $b=10.33$ (1), $c=15 \cdot 31$ (2) $\AA, \beta=131 \cdot 28$ (10) ${ }^{\circ}$, $U=2761 \AA^{3} ; Z=4, D_{m}=1.76$ (flotation), $D_{x}=1.786$ $\mathrm{g} \mathrm{cm}^{-3}$. The structure consists of centrosymmetric $\left(\mathrm{Ph}_{2} \mathrm{MeP}\right)_{2} \mathrm{Au}^{+}$cations, and $\mathrm{PF}_{6}^{-}$anions which lie on twofold axes and exhibit twofold disorder. The structure was refined to an $R$ of 0.0483 for 1760 independent observed reflexions.

Introduction. The structure of $\left(\mathrm{Ph}_{2} \mathrm{MeP}_{2}\right)_{2} \mathrm{Au}^{+} \mathrm{PF}_{6}^{-}$has been determined as part of a study of gold compounds. Many compounds are known which contain ions of the form $\mathrm{L}_{2} \mathrm{Au}^{+}$or LAuL'+ (e.g. Westland, 1969; Bonati \& Minghetti, 1973), but no crystal structure determinations have been reported.

Colourless crystals were obtained from dichloromethane/ether and were stable to air and X-rays. Intensities were determined with a Syntex $P 2_{1}$ fourcircle diffractometer, Mo $K \alpha$ radiation, a graphite monochromator and a crystal $0.06 \times 0.2 \times 0.4 \mathrm{~mm}$. 5111 reflexions were measured; averaging equivalent reflexions gave 1760 unique data with $F>4 \sigma(F)$ based on counting statistics.

The non-hydrogen atoms were located from Patterson and difference syntheses; the Au and P (of $\mathrm{PF}_{6}$ ) atoms occupy special positions $(0,0,0)$ and $\left(0, y, \frac{1}{4}\right)$ respectively. Rigid phenyl groups with C-C $1 \cdot 395, \mathrm{C}-\mathrm{H} 1.08 \AA$ and all angles $120^{\circ}$ were employed

Fig. 1. The structure in projection down $y$, showing both positions of the disordered $\mathrm{PF}_{6}^{-}$ion ( H atoms omitted for clarity).
in the final refinement because the reduction in $R^{\prime}$ ( 0.0017 for 24 additional parameters), when the C atoms were allowed to refine freely, was not considered to be significant. A rigid methyl group was employed with C-H $1.08 \AA$ and H-C-H $109.5^{\circ}$. Separate overall isotropic temperature factors were employed for the

phenyl and methyl H atoms. The $\mathrm{PF}_{6}^{-}$ion is disordered, the ion occupying either of two positions related by a twofold axis (both positions are shown in Fig. 1). The $F$ atoms all have a site occupation factor of $0 \cdot 5$. The structure was refined (with complex neutral atom scattering factors) to $R^{\prime}=\sum w^{1 / 2} \Delta / \sum w^{1 / 2}\left|F_{o}\right|=0.0518$; the corresponding unweighted $R$ was 0.0483 . The weighting scheme was $w=1 /\left[\sigma^{2}(F)+0.001 F^{2}\right]$.*

Final atomic coordinates and thermal parameters are given in Table 1 and interatomic distances and angles in Table 2.

[^0]We also succeeded in refining the structure, without $\mathrm{PF}_{6}^{-}$disorder, in the space group $C c$ (the alternative space group consistent with the systematic absences). The enantiomorphs converged to $R=0.0461$ and 0.0465 . In view of the large number of extra parameters (45), large standard deviations and the chemically less reasonable dimensions (especially for the $\mathrm{PF}_{6}^{-}$ion) which resulted, we prefer the disordered centrosymmetric model. It is unlikely that X-ray diffraction alone could distinguish between the two models.

Discussion. The $\mathrm{P}-\mathrm{Au}-\mathrm{P}$ angle in $\left(\mathrm{Ph}_{2} \mathrm{MeP}\right)_{2} \mathrm{Au}^{+}$is exactly $180^{\circ}$, since the Au atom lies on a special position at a centre of symmetry. Linear coordination is generally found for $\mathrm{Au}^{1}\left(d^{10}\right)$, e.g. in $\mathrm{Ph}_{3} \mathrm{PAuCl}$ the $\mathrm{P}-\mathrm{Au}-\mathrm{Cl}$ angle is 179.63 (8) ${ }^{\circ}$ (Baenziger, Bennett \& Soboroff, 1976). Thus the $\mathrm{L}_{2} \mathrm{Au}^{+}$cation has, as would be expected, essentially the same coordination geometry as uncharged $A u^{1}$ complexes. The $A u-P$ distance $(2 \cdot 316 \AA)$ is rather greater than in $\mathrm{Ph}_{3} \mathrm{PAuCl}$ ( $2.235 \AA$ ).

We are grateful to the Science Research Council for providing the diffractometer and for financial support to J. J. G. and P. G. J. The calculations were performed on the Cambridge University IBM 370/165 computer with programs written by G. M..S. The figure was drawn with the program PLUTO written by Dr W. D. S. Motherwell. The compound was provided by Mr G. C. H. Jones.
