## Table 3. Torsion angles

The convention used is that of the IUPAC-IUB Commission on Biochemical Nomenclature (1970).

| $\left[\mathrm{C}(2)^{\prime}-\mathrm{N}(1)-\mathrm{C}(1)^{\alpha}-\mathrm{C}(1)^{\prime}\right]$ | $\varphi_{1}$ | $26 \cdot 4^{\circ}$ |
| :--- | ---: | ---: |
| $\left[\mathrm{C}()^{\prime}-\mathrm{N}(2)-\mathrm{C}(2)^{\alpha}-\mathrm{C}(2)^{\prime}\right]$ | $\varphi_{2}$ | $30 \cdot 4$ |
| $\left[\mathrm{~N}(1)-\mathrm{C}(1)^{\alpha}-\mathrm{C}(1)^{\prime}-\mathrm{N}(2)\right]$ | $\psi_{1}$ | $-18 \cdot 6$ |
| $\left[\mathrm{~N}(2)-\mathrm{C}(2)^{\alpha}-\mathrm{C}(2)^{-}-\mathrm{N}(1)\right]$ | $\psi_{2}$ | $-22 \cdot 6$ |
| $\left[\mathrm{C}(1)^{\alpha} \mathrm{C}(1)^{-} \mathrm{N}(2)-\mathrm{C}(2)^{\alpha}\right]$ | $\omega_{1}$ | $-9 \cdot 3$ |
| $\left[\mathrm{C}(2)^{\alpha}-\mathrm{C}(2)^{\prime}-\mathrm{N}(1)-\mathrm{C}(1)^{\alpha}\right]$ | $\omega_{2}$ | $-5 \cdot 3$ |

As with c-Sar-Val, the molecules are held together by a linear array of hydrogen bonds of length $2 \cdot 90$ (1) $\AA \AA$, each molecule having one donor site $[\mathrm{N}(1)-\mathrm{H}]$ and one acceptor site $\left[\mathrm{C}(1)^{\prime}=\mathrm{O}(1)\right]$ with the second carbonyl group $\left[\mathrm{C}(2)^{\prime}=\mathrm{O}(2)\right]$ not being hydrogen bonded. The closest $\mathrm{H} \cdots \mathrm{H}$ contacts are $2 \cdot 14 \AA$ for $\mathrm{H}(1) \cdots \mathrm{H}(10)$ (intramolecular) and $2 \cdot 41 \AA$ for $\mathrm{H}(5) \cdots \mathrm{H}(7)$ (intermolecular, related by $2_{1}$ screw parallel to $\mathbf{a}$ ).

We are grateful to M. Thomas for help with data collection and to Drs D. B. Davies and M. A. Khaled for supplying the crystals and for helpful discussions.

# Utahin, a Ditropolonofuran 

By Bengt Karlsson, Anne-Marie Pilotti and Anne-Charlotte Wiehager<br>Department of Structural Chemistry, Arrhenius Laboratory, University of Stockholm, S-104 05 Stockholm, Sweden

(Received 16 February 1976; accepted 9 May 1976)

#### Abstract

C}_{20} \mathrm{H}_{20} \mathrm{O}_{5}\), isolated from Juniperus utahensis Lemm, triclinic, space group $P \overline{\mathrm{I}}$, with $Z=2, a=$ $13 \cdot 106$ (3), $b=10 \cdot 724$ (2), $c=7.640$ (2) $\AA, \alpha=98 \cdot 45$ (2), $\beta=125.03$ (3), $\gamma=99.33(4)^{\circ}, V=828.4 \AA^{3}, D_{c}=1.356 \mathrm{~g}$ $\mathrm{cm}^{-3}$. The structure was determined by the application of direct methods and refined by full-matrix least squares to a final $R$ of 0.041 for the 1257 observed intensities collected with a Philips PW 1100 computercontrolled diffractometer. The tropolone systems are only approximately planar and exhibit bond-length alternations indicating some double-bond fixation both for C-C and C-O bonds. Each part of the ditropolonoid is involved in intramolecular hydrogen bonds; only one of the parts is involved in intermolecular hydrogen bonds. The latter hold together dimers of centrosymmetrically related molecules.

Introduction. $\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{O}_{5}$ has been isolated from Juniperus utahensis Lemm, and from spectral data and chemical properties was established to be a symmetrical diisopropylditropolonofuran (Baggaley \& Norin, 1968). An investigation was undertaken to determine the complete structure and to study the delocalization of the $\pi$-electron system of this ditropolonoid.

Cell dimensions and intensities were measured from a crystal of approximate volume $0.0005 \mathrm{~mm}^{3}$ on the

Philips PW 1100 computer-controlled diffractometer with graphite-monochromatized $\mathrm{Cu} K \alpha$ radiation. The lattice constants were determined by least-squares refinement of the setting angles of 25 accurately centred reflexions. The $\omega-2 \theta$ scan technique was employed to measure reflexions out to $0=65^{\circ}$ at a scan speed of $0.016^{\circ} \mathrm{s}^{-1}$. Backgrounds were estimated by stationary counting at $\pm 0.752 \theta$ from the peak maxima. Three reference reflexions were measured approximately every 90 min . No systematic variation was detected. 2836 unique reflexions were measured. Of these, the 1255 satisfying the condition $\sigma(I) / I \leq 0.25$ were selected for subsequent refinement. Lorentz and polarization factors were applied but no correction for absorption was made.

The absolute scale and overall temperature factor for the calculation of normalized structure factor magnitudes were estimated by Wilson's (1942) method. The structure was solved by a modified version of the MULTAN direct phase-determination procedure (Germain, Main \& Woolfson, 1970) from the 344 reflexions with $|E| \geq 1 \cdot 45$. An $E$ map computed from well phased reflexions displayed 20 of the non-H atoms as prominent peaks. The structure was refined by the full-matrix least-squares method. When the $R$ value reached 0.072 with anisotropic temperature factors, a

Fig. 2. (a) Bond distances in the molecule. (b) Bond angles in the molecule.
difference synthesis revealed all the H atoms. The H atoms were given the final isotropic thermal parameters of the atoms to which they are attached and only the positional parameters were included in further refinement. $R$ fell to 0.041 after two cycles of refinement for 1255 reflexions.* The Freeman (1959) scattering fac-

tors for O and C and those of Stewart, Davidson \& Simpson (1965) for H were used throughout the analysis. Hughes's (1941) weighting scheme was used throughout with an $F_{o, \text { min }}$ of 4.5 . The final positional and thermal parameters of the non- H atoms, together with their standard deviations, are listed in Table 1 and those of the H atoms in Table 2.

Discussion. The structural and conformational features of the utahin molecule are illustrated in Fig. 1. The bond lengths and angles are shown in Fig. 2. Standard deviations are estimated to be $0.005 \AA$ and $0.4^{\circ}$ respectively. Somewhat larger values, about $0.007 \AA$, are observed for the bond lengths involving atoms $C(9), C^{\prime}(9), C(10), C^{\prime}(10), C(11)$ and $C^{\prime}(11)$. No corrections for thermal vibrations have been made.

The tropolone rings exhibit bond-length alternation in accordance with those in the crystal structures of $\beta$-thujaplicin (Derry \& Hamor, 1972), $\gamma$-thujaplicin (Berg, Karlsson, Pilotti \& Wiehager, 1976), tropolone (Shimanouchi \& Sasada, 1973) and chanootin (Karlsson, Pilotti \& Wiehager, 1973). Bond lengths from these studies together with the results of a molecular orbital treatment of tropolone (Dewar \& Trinajstic, 1970) are listed in Table 3.

The $C(5)-C(6)$ and $C^{\prime}(5)-C^{\prime}(6)$ bonds are 1.469 and $1 \cdot 474 \AA$ respectively, close to the $\mathrm{C}\left(s p^{2}\right)-\mathrm{C}\left(s p^{2}\right)$ singlebond value. The other C-C 'single' bonds are, however, significantly shorter. The mean value of these bonds is $1.423 \AA$. The mean 'double' bond value is $1.365 \AA$. The C-O bonds are also involved in the electron delocalization. The average values of bonds involving carbonyl O and hydroxyl O are 1.247 and $1.346 \AA$ respectively.
The equations of various least-squares planes and deviations from these planes are listed in Table 4. The two seven-membered rings deviate only slightly from planarity, maximally 0.021 and $0.013 \AA$. The whole molecule, excluding atoms $\mathrm{C}(10), \mathrm{C}^{\prime}(10), \mathrm{C}(11)$ and
$\mathrm{C}^{\prime}(11)$, is planar within $\pm 0.038 \AA$. The conformations of the isopropyl groups are such that atoms $\mathrm{C}(10)$ and $\mathrm{C}(11)$ deviate from the non-primed tropolone ring by 1.480 and $-0.717 \AA$ respectively, and atoms $\mathrm{C}^{\prime}(10)$ and $\mathrm{C}^{\prime}(11)$ deviate from the primed tropolone ring by -1.481 and $0.546 \AA$ respectively. Relevant torsion angles for these groups are given in Table 5.

## Table 4. Least-squares planes and deviations $(\AA)$

The planes are described in terms of normalized equations in the orthogonal coordinate system ( $m, n, p$ ) having $p \| c, n$ in the $b c$ plane, and $m$ in the $a, b, c$ octant.

$$
\begin{array}{ll}
\text { Plane } A & -0.0348 m-0.4540 n-0.8903 p=4.4080 \\
\text { Plane } B & -0.0363 m-0.4523 n-0.8911 p=4.3966 \\
\text { Plane } C & -0.0303 m-0.4521 n-0.8914 p=4.4635
\end{array}
$$

The interior angles of the seven-membered rings range from $122 \cdot 7$ to 133.7 and 123.5 to $133 \cdot 5^{\circ}$ for the unprimed and primed units respectively. In both ring systems the smallest angle is at the C atom to which the isopropyl group is attached. The angles at the carbonyl C atoms, $125 \cdot 6$ and $125 \cdot 7^{\circ}$ respectively, are the next smallest here; however, in all the related structures these are the smallest angles.

Table 5. Torsion angles $\left({ }^{\circ}\right)$ of the isopropyl groups

| $\mathrm{C}(10)-\mathrm{C}(9)-\mathrm{C}(3)-\mathrm{C}(2)$ | $-86 \cdot 8$ |
| :--- | ---: |
| $\mathrm{C}(10)-\mathrm{C}(9)-\mathrm{C}(3)-\mathrm{C}(4)$ | $90 \cdot 9$ |
| $\mathrm{C}(11)-\mathrm{C}(9)-\mathrm{C}(3)-\mathrm{C}(2)$ | $147 \cdot 8$ |
| $\mathrm{C}(11)-\mathrm{C}(9)-\mathrm{C}(3)-\mathrm{C}(4)$ | $-34 \cdot 5$ |

| $C^{\prime}(10)-C^{\prime}(9)-C^{\prime}(3)-C^{\prime}(2)$ | $-79 \cdot 2$ |
| :--- | ---: |
| $C^{\prime}(10)-C^{\prime}(9)-C^{\prime}(3)-C^{\prime}(4)$ | $99 \cdot 0$ |
| $C^{\prime}(11)-C^{\prime}(9)-C^{\prime}(3)-C^{\prime}(2)$ | $153 \cdot 6$ |
| $C^{\prime}(11)-C^{\prime}(9)-C^{\prime}(3)-C^{\prime}(4)$ | $-28 \cdot 1$ |

Fig. 3. The unit cell in projection along the $b$ axis. Intermolecular hydrogen bonds are marked with dotted lines. - Carbon. - Oxygen.

Intramolecular hydrogen bonds are observed in each tropolone moiety in utahin. The distances $\mathrm{O}(12)-\mathrm{O}(13)$ and $\mathrm{O}^{\prime}(12)-\mathrm{O}^{\prime}(13)$ are 2.510 and $2.586 \AA$ respectively. H atoms are found at normal X-ray-measured bond distances ( 0.82 and $0.82 \AA$ ) from $O(13)$ and $O^{\prime}(13)$ and at 1.94 and $2 \cdot 11 \AA$, respectively, from $O(12)$ and $\mathrm{O}^{\prime}(12)$. The angles $\mathrm{O}(13)-\mathrm{H}(\mathrm{O} 13) \cdots \mathrm{O}(12)$ and $\mathrm{O}^{\prime}(13)-$ $\mathrm{H}\left(\mathrm{O}^{\prime} 13\right) \cdots \mathrm{O}^{\prime}(12)$ are 126 and $117^{\circ}$ respectively. However, only the primed parts of the molecules are involved in intermolecular hydrogen bonding to form hydrogen-bonded dimers of centrosymmetrically related molecules. The intermolecular distance $\mathrm{H}\left(\mathrm{O}^{\prime} 13\right)$ $\cdots \mathrm{O}^{\prime}\left(12^{\mathrm{i}}\right)(\mathrm{i} \equiv 2-x,-y, 1-z)$ is $2 \cdot 04 \AA$ and the angle $\mathrm{O}^{\prime}(13)-\mathrm{H}\left(\mathrm{O}^{\prime} 13\right) \cdots \mathrm{O}^{\prime}\left(12^{\mathrm{i}}\right)$ is $152^{\circ}$. The distance $\mathrm{O}^{\prime}(13)$ $\cdots \mathrm{O}^{\prime}\left(12^{\mathrm{i}}\right)$ is $2.793 \AA$. Other intermolecular contacts
are normal van der Waals distances. The crystal packing projected along the $b$ axis is shown in Fig. 3.

The present investigation has received financial support from the Swedish Natural Science Research Council. The authors express their gratitude to Professor Peder Kierkegaard for his active and stimulating interest in this work. Professor Torbjörn Norin has kindly supplied the crystals used in the work. The authors also wish to thank Dr Don Koenig who corrected the English of this paper.

#### Abstract

C}_{10} \mathrm{H}_{12} \mathrm{O}_{2}\), monoclinic, $P 2_{1} / n, a=7.573$ (2), $b=18 \cdot 311$ (5), $c=6.632$ (2) $\AA, \beta=105 \cdot 1$ (2) ${ }^{\circ}, Z=4$, $V=887.9 \AA^{3}, D_{c}=1.227 \mathrm{~g} \mathrm{~cm}^{-3}$. The final $R$ value is 0.064 for 1078 observed independent reflexions. The $\pi$-electron system in the tropolone moiety is only partially delocalized with some double-bond localization both for C-C and C-O bonds. The hydroxyl H participates in a bifurcated hydrogen bond, of which one branch is intramolecular and the other intermolecular.

Introduction. Intensities were obtained from two crystals with approximate volumes 0.0045 and $0.002 \mathrm{~mm}^{3}$ on a computer-controlled diffractometer (Philips PW 1100, graphite monochromator, $\mathrm{Cu} K \alpha$ radiation, $\omega / 20$
scan, stationary background measurements at the beginning and end of each scan). 1695 unique reflexions up to $\theta=70^{\circ}$ were measured. Of these, the 1078 satisfying the condition $\sigma(I) / I \leq 0.25$ were used for subsequent refinement. During the data collection three monitor reflexions measured at intervals of approximately 1.5 h showed a decrease in intensity of $10-15 \%$, from both crystals. Individual reflexions were corrected for this loss by fitting a linear function of time to the intensities of the monitor reflexions.
The cell constants were refined by least squares from diffractometer-measured settings of 25 reflexions. The structure was solved by the multisolution tangent-formula refinement (Germain, Main \& Woolfson, 1971)
