# REACTIONS OF ISOPROPYLISOCYANIDE AND *t*-BUTYLISOCYANIDE WITH COBALT(II) PERCHLORATE AND TETRAFLUOROBORATE

CLIFFORD A. L. BECKER

Department of Chemistry, University of Bahrain, P.O. Box 32038, Bahrain, Arabian Gulf

(Received June 2, 1992)

Reaction of isopropylisocyanide with  $\text{CoX}_2 \cdot 6\text{H}_2\text{O}$  ( $\text{X} = \text{ClO}_4, \text{BF}_4$ ) in EtOH produced  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$ , and reaction of *t*-butylisocyanide, produced  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$ . The complexes were characterized by IR, electronic spectra, magnetic susceptibility, and molar conductivity.  $\text{CNCHMe}_2$  complexes are diamagnetic in the solid state and one-electron paramagnetic in solution; this and other data are consistent with dimerization in the solid and dissociation in solution.  $\text{CNCMe}_3$  complexes are one-electron paramagnetic in the solid and solution states, this being consistent with a monomeric structure.

**Keywords:** Isopropylisocyanide, *t*-butylisocyanide, cobalt(II), dinuclear complexes

## INTRODUCTION

Organoisocyanide reactions with cobalt(II) have been investigated with arylisocyanides and alkylisocyanides. *Pentakis*(arylisocyanide)cobalt(II) complexes,  $[\text{Co}(\text{CNR})_5]\text{X}_2 \cdot n\text{H}_2\text{O}$  ( $\text{X} = \text{ClO}_4, \text{BF}_4$ ), are reported for reaction of stoichiometric or excess RNC with Co(II).<sup>1-6</sup> Monomeric *pentakis*(methylisocyanide)cobalt(II) perchlorate, as blue, paramagnetic crystals, was initially reported<sup>1,3,7</sup> for reaction of  $\text{Co}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$  with excess CNMe in EtOH, but could not be reproduced.<sup>4</sup> The red, diamagnetic isomer<sup>1,3,7</sup> is a metal-metal bonded dimer,<sup>8</sup>  $[(\text{MeNC})_5\text{Co}-\text{Co}(\text{CNMe})_5](\text{ClO}_4)_4$ . Analogously,  $[\text{Co}_2(\text{CNEt})_{10}](\text{ClO}_4)_4$  has also been reported.<sup>9</sup> Only *t*-butylisocyanide has been observed to form a *tetrakis*(alkylisocyanide)cobalt(II) complex,  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}](\text{ClO}_4)_2$ , upon initial reaction with  $\text{Co}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$  in EtOH,<sup>10</sup> although sterically-hindered arylisocyanides form *tetrakis* complexes containing coordinated perchlorate ions,  $[\text{Co}(\text{CNR})_4(\text{ClO}_4)_2]$ ,  $\text{R} = 2,6\text{-Me}_2\text{C}_6\text{H}_3, 2,6\text{-Et}_2\text{C}_6\text{H}_3, 2,6\text{-(Me}_2\text{CH)}_2\text{C}_6\text{H}_3$ .<sup>11-13</sup>

This present work investigates reactions of  $\text{CNCHMe}_2$  with  $\text{Co}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$  and  $\text{Co}(\text{BF}_4)_2 \cdot 6\text{H}_2\text{O}$  in EtOH, and  $\text{CNCMe}_3$  with  $\text{Co}(\text{BF}_4)_2 \cdot 6\text{H}_2\text{O}$ . This should establish whether  $\text{CNCHMe}_2$  reacts analogously to CNMe and CNEt, or to  $\text{CNCMe}_3$ . This should also establish whether the  $\text{ClO}_4^-$  anion is critical in formation of a *tetrakis* complex, or if coordination is determined by the  $\text{CNCMe}_3$  ligand.

## EXPERIMENTAL

*Reagents*

Commercial alkylisocyanides (Strem), CNCHMe<sub>2</sub>, CNCMe<sub>3</sub>, CNC<sub>4</sub>H<sub>9-n</sub>, CNC<sub>6</sub>H<sub>11</sub>, were used without redistillation. Diethyl ether was filtered through an alumina column immediately before use.

*Instrumentation*

IR spectra were recorded on a Perkin Elmer 1710 FT-IR instrument. Solution electronic spectra were recorded on a Shimadzu UV-365. Diffuse reflectance spectra were recorded on a Cary Model 2390; powdered samples were measured relative to BaSO<sub>4</sub>. Molar conductivities were measured on ~0.001 M samples at 25.0°C using a Crison 525 conductimeter. Magnetic susceptibilities were measured at room temperature using a Johnson Matthey magnetic susceptibility balance. Effective magnetic moments were calculated assuming Curie Law behaviour. The C, H, N, and Cl analyses were performed commercially; Co was analyzed by atomic emission using a Spectroscan III DC argon plasma atomic emission spectrometer. Samples were digested in conc. nitric acid.

$$[\text{Co}_2(\text{CNCHMe}_2)_{10}](\text{ClO}_4)_4 \cdot 5\text{H}_2\text{O}$$

A solution of 10.0 g CNCHMe<sub>2</sub> in 10.0 cm<sup>3</sup> of EtOH was added dropwise to a filtered, well-stirred solution of 10.6 g Co(ClO<sub>4</sub>)<sub>2</sub>·6H<sub>2</sub>O (*i.e.*, 5:1 CNR:Co mole ratio) in 50 cm<sup>3</sup> of EtOH and chilled in ice. A dark blue solution resulted, but no precipitate was observed. The mixture was warmed to room temperature, then 75 cm<sup>3</sup> of ether was added in small aliquots, and the solution chilled to 0°C. Crystals formed within 30 min, but the solution was chilled overnight for complete precipitation. The mixture was filtered cold, separating maroon-red crystals from a green filtrate. The product was washed with two 20 cm<sup>3</sup> portions of ether and sucked dry in air. Yield: 14.7 g (78%). The product is hygroscopic and was stored under desiccation. Anal.: calc. for Co<sub>2</sub>C<sub>40</sub>H<sub>70</sub>Cl<sub>4</sub>N<sub>10</sub>O<sub>16</sub>·5H<sub>2</sub>O: C, 37.05; H, 6.22; N, 10.80; Cl, 10.94; Co, 9.1%. Found: C, 36.74; H, 6.15; N, 10.94; Cl, 10.82; Co, 9.5%.

## RESULTS AND DISCUSSION

### Syntheses of the Complexes

Reaction of isopropylisocyanide with cobalt(II) is analogous to reactions of CNMe and CNEt, but not to CNCMe<sub>3</sub>; a *tetrakis* complex with *t*-butylisocyanide can be

prepared with  $\text{BF}_4^-$  as well as  $\text{ClO}_4^-$ . Reaction with *n*-butylisocyanide is analogous to that with isopropylisocyanide, but the complexes were not well-crystallized so characterization was not attempted. Reaction with cyclohexylisocyanide is also analogous, but the complexes are very soluble, the maroon crystals softening to a blue oil upon warming to room temperature. Thus  $\text{CNCMe}_3$  appears unique for alkylisocyanides in forming *tetrakis* Co(II) complexes.

Solubility differences distinguish the  $\text{CNCHMe}_2$  and  $\text{CNCMe}_3$  complexes;  $\text{CNCHMe}_2$  complexes are significantly more soluble in polar organic solvents. Solubility is crucial in the syntheses.  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$  readily precipitate from ethanol solution.  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  require ether addition and extensive chilling for precipitation, and cold filtration without rinse to prevent redissolution. Complexes with  $\text{CNC}_6\text{H}_{11}$  are too soluble to crystallize from ethanol, and complexes with  $\text{CNC}_4\text{H}_9$ -*n* become intractable after precipitation.  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$  species are recrystallized from  $\text{CH}_3\text{CN}$ ,  $\text{C}_2\text{H}_5\text{CN}$ , or  $\text{CH}_3\text{NO}_2$  and ether, while recrystallization of  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  is difficult and unsatisfactory; freshly-prepared samples were characterized.

#### Characterization in the Solid State

Diffuse reflectance electronic spectra for the complexes (see Figure 1) are reasonable for tetragonal or five-coordinate Co(II); tetrahedral geometry is excluded. Spectra

FIGURE 1 Diffuse reflectance electronic spectra for  $[\text{Co}_2(\text{CNCHMe}_2)_{10}](\text{ClO}_4)_4 \cdot 5\text{H}_2\text{O}$  (top) and  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}](\text{ClO}_4)_2$  (bottom).

for  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  and  $[\text{Co}_2(\text{CNMe})_{10}](\text{ClO}_4)_4$  (Ref. 4) are very similar, so an analogous structure is suggested. Spectra for the  $\text{CNCHMe}_2$  and  $\text{CNCMe}_3$  complexes are quite similar, as expected for pseudo-octahedral and square pyramidal  $\text{Co}(\text{II})$  with the same ligands.

Magnetic susceptibilities indicate one-electron paramagnetism for  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$ . This is reasonable for square pyramidal or square planar coordination of strong field ligands; tetrahedral coordination is excluded.  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  complexes are diamagnetic when freshly prepared, becoming paramagnetic with age. Measured diamagnetism is in reasonable agreement with calculated values (Table I and literature<sup>14</sup>);  $[\text{Co}_2(\text{CNCHMe}_2)_{10}](\text{ClO}_4)_4 \cdot 5\text{H}_2\text{O}$ ,  $\chi_M = -500 \pm 32 \times 10^{-6}$ ,  $-678 \times 10^{-6}$ ;  $[\text{Co}_2(\text{CNCHMe}_2)_{10}](\text{BF}_4)_4 \cdot 5\text{H}_2\text{O}$ ,  $\chi_M = -540 \pm 13 \times 10^{-6}$ ,  $-686 \times 10^{-6}$  (cgs). Diamagnetism supports a proposed dimeric structure with a direct  $\text{Co}-\text{Co}$  bond,  $[(\text{Me}_2\text{HCNC})_5\text{Co}-\text{Co}(\text{CNCHMe}_2)_5]\text{X}_4 \cdot 5\text{H}_2\text{O}$ .

The  $\nu(-\text{N}\equiv\text{C})$  patterns of one broad band with shoulders suggests slightly different RNC ligands, bridging RNC being excluded. Frequencies of the strong bands, 2231, 2236  $\text{cm}^{-1}$  ( $\text{CNCHMe}_2$ ) (2216, 2218 ( $\text{CNCMe}_3$ )) shift to higher energy relative to the free ligand (2144, 2136  $\text{cm}^{-1}$ , respectively), indicating coordinated RNC provides more  $\sigma$ -donation than  $\pi^*$ -acceptance, as expected in  $\text{Co}(\text{II})$  complexes. The  $\nu(\text{ClO}_4^-)$  and  $\nu(\text{BF}_4^-)$  modes are normal for symmetrical anions, so  $\text{ClO}_4^-$  coordination is excluded. The doubled  $\nu(\text{O}-\text{H})$  band in  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}](\text{ClO}_4)_2$  is suggestive of a coordinated water molecule. The  $\nu(\text{O}-\text{H})$  stretches in  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}](\text{BF}_4)_2 \cdot 2.5\text{H}_2\text{O}$  are stronger and widely separated, suggesting coordinated and non-coordinated water molecules.

The structure of  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}](\text{BF}_4)_2 \cdot 2.5\text{H}_2\text{O}$  is almost certainly analogous to that of  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}](\text{ClO}_4)_2$ , with extra water molecules being non-coordinated. One  $\text{H}_2\text{O}$  molecule is presumably coordinated; four coordination is not expected.<sup>15,16</sup> The most probable structure is square pyramidal  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]^{2+}$ , with  $\text{H}_2\text{O}$  in the apical position. The  $\text{CNCMe}_3$  ligand, not the  $\text{ClO}_4^-$  anion, is determinative in formation of *tetrakis*(alkylisocyanide)-cobalt(II) complexes. Structures for  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  are almost certainly analogous to each other, and probably involve a  $\text{Co}-\text{Co}$  bond without bridging CNR.

TABLE I  
Measured diamagnetic susceptibilities

Formula	$\chi_g \times 10^9$	$\chi_M \times 10^6$
$\text{CNCHMe}_2$	$-664 \pm 9$	$-45.9 \pm 0.6$
$\text{CNCMe}_3$	$-647 \pm 11$	$-53.8 \pm 0.9$
$\text{NaBF}_4$	$-372 \pm 7$	$-40.9 \pm 0.8$
$\text{CH}_3\text{CN}$	$-624 \pm 14$	$-25.6 \pm 0.6$
$\text{CH}_3\text{NO}_2$	$-327 \pm 6$	$-19.9 \pm 0.4$

$\text{CF}_3\text{CH}_2\text{OH}$	$-411 \pm 11$	$-41.1 \pm 1.1$
$\text{CH}_3\text{C}(\text{O})\text{CH}_3$	$-543 \pm 8$	$-31.5 \pm 0.5$
$\text{CH}_3\text{C}(\text{O})\text{C}_2\text{H}_5$	$-574 \pm 14$	$-41.4 \pm 1.0$

### Characterization in Solution

The Co-Co bond proposed in  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  dissociates in solution; no evidence suggests dimer  $\rightleftharpoons$  monomer equilibrium. Molar conductivities in  $\text{CH}_3\text{CN}$ ,  $\text{CH}_3\text{NO}_2$ ,  $\text{CH}_3\text{C}(\text{O})\text{CH}_3$ , and  $\text{CH}_3\text{OH}$  for all complexes are appropriate for fully dissociated 2:1 electrolytes.<sup>17</sup> The solubilities and  $\Lambda_{\text{M}}$  values attest to dissociation of the  $\text{CNCHMe}_2$  complexes; a 4:1 salt should have limited solubility and show significant ion-pairing.

The  $\nu(-\text{N}\equiv\text{C})$  bands for  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$  in  $\text{CH}_3\text{NO}_2$  are effectively identical, with one strong band at  $2225\text{ cm}^{-1}$ ; the  $\nu(-\text{N}\equiv\text{C})$  for  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  in  $\text{CH}_3\text{NO}_2$  is strong at  $2231, 2233\text{ cm}^{-1}$ . These frequencies are appropriate for Co(II) complexes. IR spectra in  $\text{CH}_2\text{Cl}_2$  show a strong band at  $2227, 2229\text{ cm}^{-1}$ ; and a  $2119, 2161\text{--}2162\text{ cm}^{-1}$  pattern indicative of  $[\text{Co}(\text{CNR})_5]\text{X}$ .<sup>18,19</sup> The  $\nu(-\text{N}\equiv\text{C})$  modes for  $[\text{Co}(\text{CNR})_5]^+$  are extremely intense, so only slight reduction has probably taken place in solution.

Mass susceptibilities for the complexes in 3–10% by weight solution were calculated  $\left(\chi_{\text{g}} = \left(\frac{m_1 + m_0}{m_1}\right) \chi_{\text{I}}^{\text{solution}} - \left(\frac{m_0}{m_1}\right) \chi_{\text{I}}^0\right)$  using measured susceptibilities ( $\chi_0$ ) for the solvents (Table I). Effective  $\chi_{\text{I}}$  magnetic moments ( $\mu_{\text{eff}} = 2.85\text{--}3.0\text{ BM}$ ) for  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$  are in the upper range expected for low-spin

TABLE II  
Solution electronic spectroscopic data for  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$  and  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$

Solvent	Electronic spectrum <sup>a</sup>

<sup>a</sup>The  $\lambda_{\text{max}}(\epsilon)$  in nm ( $\text{m}^{-1}\text{ cm}^{-1}$ ) without Gaussian resolution.

\* Possible solvent interference.

Co(II),<sup>14</sup> but still indicative of one unpaired electron rather than three ( $\mu_{\text{eff}} = 4.30\text{--}5.20 \text{ BM}^{14}$ ). The  $\mu_{\text{eff}}$  values for  $[\text{Co}_2(\text{CNCHMe}_2)_{10}]\text{X}_4 \cdot 5\text{H}_2\text{O}$  (1.90–2.90 BM) are also within the range expected for low-spin Co(II).<sup>14</sup>

Solution electronic spectra are summarized in Table II. Decreasing  $\lambda_{\text{max}}$  and  $\epsilon$  for the first band with increasing solvent coordinating ability is observed. In non-coordinating solvents ( $\text{CF}_3\text{CH}_2\text{OH}$ ,  $\text{CH}_3\text{NO}_2$ ), producing olive-green solutions, square pyramidal  $[\text{Co}(\text{CNCHMe}_2)_5]^{2+}$  and  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]^{2+}$  (with expected high  $\epsilon$ ) are probably present, although  $[\text{Co}(\text{CNCHMe}_2)_5\text{H}_2\text{O}]^{2+}$  and  $[\text{Co}(\text{CNCMe}_3)_4]^{2+}$  cannot be excluded. In coordinating solvents ( $\text{CH}_3\text{CN}$ ,  $\text{CH}_3\text{OH}$ ), giving blue solutions, pseudo-octahedral  $[\text{Co}(\text{CNCHMe}_2)_5\text{S}]^{2+}$  and *trans*- $[\text{Co}(\text{CNCMe}_3)_4\text{S}_2]^{2+}$  can be expected. Spectra for  $[\text{Co}(\text{CNCMe}_3)_4\text{H}_2\text{O}]\text{X}_2 \cdot n\text{H}_2\text{O}$  in  $\text{CH}_3\text{OH}$  are similar to diffuse reflectance spectra of  $[\text{Co}(\text{CNCMe}_3)_4\text{L}_2](\text{ClO}_4)_2 \cdot n\text{H}_2\text{O}$ ,  $\text{L} = \text{C}_5\text{H}_5\text{N}$ , 3-MeC<sub>5</sub>H<sub>4</sub>N, 4-MeC<sub>5</sub>H<sub>4</sub>N, C<sub>5</sub>H<sub>10</sub>NH,  $\text{HN}(\text{CH}_2\text{CH}_2)_2\text{O}$ .<sup>20</sup> In solvents of intermediate coordinating ability ( $\text{CH}_2\text{Cl}_2$ , acetone), showing bluegreen solutions,  $\text{ClO}_4^-$  and  $\text{BF}_4^-$  salts show greatest differences, so formation of  $[\text{Co}(\text{CNCHMe}_2)_5\text{S}]^{2+}$  may be incomplete.
