

SULFUR-TETRAFLUORIDE-IMIDES AND PENTAFLUOROSULFANYL-DERIVATIVES

A. WATERFELD AND R. MEWS

Anorganisch-Chemisches Institut der Universität, Tammanstrasse 4,
D-3400 Göttingen

Pentafluorosulfanyl-derivatives are obtained by the addition of Cl_2 or chlorides to the NS-triple bond of NSF_3 in the presence of HgF_2 :

(In the same way perfluoroalkyl-dichloro-amines were prepared from nitriles;

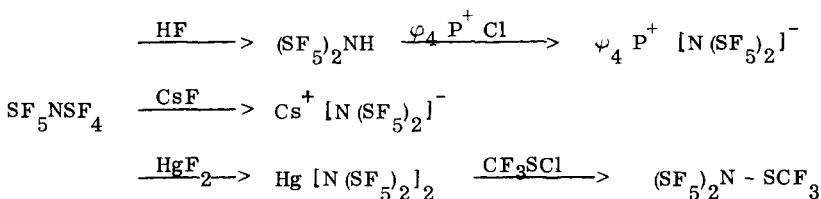

e.g.

From the reaction of NSF_3 with ClF , besides SF_5NCl_2 ^[1], the cyclic sulfurtetra-fluorideimide $(\text{ClNSF}_4)_2$ ^[2] is isolated.

From NSF_3 and F_2 pentafluorosulfanyl-sulfurtetrafluorideimide is formed

the key substance to bis(pentafluorosulfanyl)amines.

The properties of these compounds will be discussed in detail.
