REACTIONS OF PHENYLTELLURIUM(VI) FLUORIDES WITH ALCOHOLS, AMINES AND SILICON COMPOUNDS\*

ALEXANDER F JANZEN, KOHRSHED ALAM and BARRY J BLACKBURN

Department of Chemistry, University of Manitoba, Winnipeg, Manitoba R3T 2N2 (Canada)

## SUMMARY

The reactions of phenyltellurium(VI) fluorides,  $\text{PhTeF}_5$ , *trans*- $\text{Ph}_2\text{TeF}_4$  and *mer*- $\text{Ph}_3\text{TeF}_3$ , with alcohols and amines, or their trimethylsilyl derivatives, are described. The products  $\text{PhTeF}_4\text{X}$ ,  $\text{Ph}_2\text{TeF}_3\text{X}$  and  $\text{Ph}_3\text{TeF}_2\text{X}$  ( $\text{X}=\text{OMe}$ ,  $\text{NMe}_2$ ,  $\text{NEt}_2$ ) were characterized by  $^{19}\text{F}$  NMR and isomeric structures are assigned on the basis of their NMR spectra. Samples of *trans*- $\text{Ph}_2\text{TeF}_4$  contain small amounts of *cis*- $\text{Ph}_2\text{TeF}_4$ .

## RESULTS AND DISCUSSION

The reactions of phenyltellurium(VI) fluorides [1,2], *i.e.*  $\text{PhTeF}_5$ , *trans*- $\text{Ph}_2\text{TeF}_4$  and *mer*- $\text{Ph}_3\text{TeF}_3$ , with alcohols and amines were carried out by using either NaF or  $\text{R}_2\text{NH}$  as the HF acceptor, or by choosing the corresponding trimethylsilyl derivative

The products  $\text{PhTeF}_4\text{X}$ ,  $\text{Ph}_2\text{TeF}_3\text{X}$  and  $\text{Ph}_3\text{TeF}_2\text{X}$  ( $\text{X}=\text{OMe}$ ,  $\text{NMe}_2$ ,  $\text{NEt}_2$ ) 1-7 were identified on the basis of their  $^{19}\text{F}$  NMR spectra (Table 1) which are in agreement with those of related Te(VI) fluorides [1-4]. The *cis* geometry of  $\text{PhTeF}_4\text{X}$  1-2 is established by the  $\text{ABC}_2$  spin system and  $\text{F}^{\text{A}}$  is assigned to a

site trans to a phenyl substituent because it has been found that a phenyl group in  $\text{Ph}_3\text{TeF}_3$  [2],  $\text{Ph}_3\text{TeF}_2\text{Cl}$  [1] and  $\text{Ph}_3\text{TeF}_2\text{OH}$  [5] produces a large downfield shift in the trans fluorine.

$\text{PhTeF}_4\text{X}$

1 X=OMe  
2 X=NMe<sub>2</sub>

$\text{Ph}_2\text{TeF}_3\text{X}$

4a X=NMe<sub>2</sub>  
5a X=NEt<sub>2</sub>

$\text{Ph}_2\text{TeF}_3\text{X}$

4b X=NMe<sub>2</sub>  
5b X=NEt<sub>2</sub>

$\text{Ph}_3\text{TeF}_2\text{X}$

6 X=OMe  
7 X=NMe<sub>2</sub>

Compounds 3-5 have AB<sub>2</sub> spectra and two isomers of  $\text{Ph}_2\text{TeF}_3\text{X}$  are shown above. The downfield shift of F<sup>A</sup> in 4a and 5a suggests a structure in which F<sup>A</sup> is trans to a phenyl substituent, but the structure of  $\text{Ph}_2\text{TeF}_3\text{OMe}$  3 remains uncertain. A third isomer of  $\text{Ph}_2\text{TeF}_3\text{X}$ , in which both fluorines are trans to phenyls, would be expected to show a doublet at low field, but this was not observed. For products  $\text{Ph}_3\text{TeF}_2\text{X}$  6-7, we make the assumption that the three bulky phenyl substituents adopt a *mer* arrangement, as confirmed by x-ray crystallography for  $\text{Ph}_3\text{TeF}_3$  [2] and  $\text{Ph}_3\text{TeF}_2\text{OH}$  [5], and in that case the stereochemistry of 6-7 is established by the AB spin system.

Other isomers of 1-7 were also observed by <sup>19</sup>F NMR, but they were produced in smaller yields and their characterization is incomplete.

In some reactions, there was evidence of reduction to Te(IV) species, most readily observed by the formation of  $\text{Ph}_2\text{TeF}_2$  in reactions of diphenyltellurium(VI) compounds. For example, the reaction of  $\text{Ph}_2\text{TeF}_4$  with MeOH produced some  $\text{Ph}_2\text{TeF}_2$  which increased when the reaction conditions were changed from 40°C to 50°C.

During the preparation of *trans*- $\text{Ph}_2\text{TeF}_4$ , a small amount (1-4%) of *cis*- $\text{Ph}_2\text{TeF}_4$  was observed and identified by its A<sub>2</sub>B<sub>2</sub> NMR spectrum (Table 1). Analogous compounds *cis*-(C<sub>6</sub>F<sub>5</sub>)<sub>2</sub>TeF<sub>4</sub> [6] and *cis*- $\text{Ph}_2\text{SF}_4$  [7] have been described previously.

<sup>a</sup>Chemical shifts are reported in ppm and coupling constants in Hz.

## EXPERIMENTAL

$^{19}\text{F}$  NMR spectra were recorded on a Bruker AM300 spectrometer at 282.4 MHz with the use of  $\text{C}_6\text{F}_6$  (-162.9 ppm with respect to  $\text{CFCl}_3$ ) as internal reference.  $\text{Ph}_3\text{TeF}$  [8],  $\text{Ph}_3\text{Te}^+\text{BF}_4^-$  [1] and  $\text{Ph}_3\text{TeF}_3$  [2] were prepared as described in the literature.  $\text{PhTeCl}_3$  was prepared from  $\text{TeCl}_4$  and  $\text{Ph}_3\text{SnCl}$  [9] and converted to  $\text{PhTeF}_3$  with the use of  $\text{AgF}$  [10]. The remaining starting compounds were commercial samples and used as supplied.

$\text{PhTeF}_5$  was prepared by slowly (20 min) adding solid  $\text{XeF}_2$  (0.04 g, 0.21 mmol) to a stirred solution of  $\text{PhTeF}_3$  (0.05 g, 0.19 mmol) in  $\text{CH}_2\text{Cl}_2$  (2 mL) in a Teflon bottle. After further stirring for 3 hr at  $25^\circ\text{C}$ , volatile material was removed under vacuum and the remaining viscous oil identified as  $\text{PhTeF}_5$  by  $^{19}\text{F}$  and  $^{125}\text{Te}$  NMR and MS [1].

$\text{Ph}_2\text{TeF}_2$  was prepared by slowly adding  $\text{Ph}_2\text{Te}$  (0.15 g, 0.53 mmol) in  $\text{CH}_2\text{Cl}_2$  (2 mL) through a syringe to a stirred solution of  $\text{XeF}_2$  (0.1 g, 0.59 mmol) in  $\text{CH}_2\text{Cl}_2$  (2 mL) at  $0^\circ\text{C}$ . Stirring was continued at  $25^\circ\text{C}$  for about 30 min until the evolution of Xe gas ceased and the yellow colour of the solution disappeared. Removal of volatile material under vacuum gave  $\text{Ph}_2\text{TeF}_2$  which was recrystallized from benzene/n-hexane and identified by  $^{19}\text{F}$  NMR [11].

#### Preparation of *cis*- $\text{PhTeF}_4\text{OMe}$ 1

(i)  $\text{MeOH}$  (1.9 mmol),  $\text{NaF}$  (1.8 mmol) and  $\text{PhTeF}_5$  (0.31 mmol) in  $\text{CH}_3\text{CN}/\text{CH}_2\text{Cl}_2$  (1.1, 2 mL) was stirred in a Teflon bottle for 18 h and then filtered. The filtrate was dried under vacuum and a white solid was obtained and identified (Table 1) as *cis*- $\text{PhTeF}_4\text{OMe}$  1.

(ii)  $\text{Me}_3\text{SiOMe}$  (0.35 mmol) and  $\text{PhTeF}_5$  (0.2 mmol) in  $\text{CH}_2\text{Cl}_2$  (1 mL) was kept at  $20^\circ\text{C}$  for 12 h, with occasional shaking to give  $\text{Me}_3\text{SiF}$  and *cis*- $\text{PhTeF}_4\text{OMe}$  1.

#### Preparation of *cis*- $\text{PhTeF}_4\text{NMe}_2$ 2

$\text{Me}_3\text{SiNMe}_2$  (0.54 mmol) and  $\text{PhTeF}_5$  (0.24 mmol) in  $\text{CH}_2\text{Cl}_2$  (1 mL) was kept in an NMR tube at  $20^\circ\text{C}$  for 12 hr during which time the solution turned yellow.  $\text{Me}_3\text{SiF}$  and other volatile material was removed under vacuum and the remaining solid was identified (Table 1) as *cis*- $\text{PhTeF}_4\text{NMe}_2$  2.

Preparation of Ph<sub>2</sub>TeF<sub>3</sub>OMe 3

(i) MeOH (0.61), NaF (0.91 mmol) and *trans*-Ph<sub>2</sub>TeF<sub>4</sub> (0.32 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (4 mL) was stirred for 2 days, with occasional warming, and then filtered. The filtrate was dried under vacuum and a white solid was obtained and identified (Table 1) as Ph<sub>2</sub>TeF<sub>3</sub>OMe 3.

(ii) Me<sub>3</sub>SiOMe (0.16 mmol) and *trans*-Ph<sub>2</sub>TeF<sub>4</sub> (0.10 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1 mL) was kept in an NMR tube at 20°C for 3 days to give Me<sub>3</sub>SiF and Ph<sub>2</sub>TeF<sub>3</sub>OMe 3.

Preparation of Ph<sub>2</sub>TeF<sub>3</sub>NR<sub>2</sub> R=Me (4a-4b) and R=Et (5a-5b)

(i) Me<sub>3</sub>SiNMe<sub>2</sub> (0.56 mmol) and *trans*-Ph<sub>2</sub>TeF<sub>4</sub> (0.19 mmol) in CHCl<sub>3</sub> (1 mL) was kept in a sealed tube at 20°C for 4 days, then heated to 35°C for 1 hour. Two AB<sub>2</sub> NMR spectra were observed (Table 1) and assigned to two isomers of Ph<sub>2</sub>TeF<sub>3</sub>NMe<sub>2</sub>, 4a and 4b.

Replacing Me<sub>3</sub>SiNMe<sub>2</sub> with Me<sub>3</sub>SiNEt<sub>2</sub> in the previous reaction, gave two isomers of Ph<sub>2</sub>TeF<sub>3</sub>NEt<sub>2</sub>, 5a and 5b.

(ii) Me<sub>2</sub>NH (0.65 mmol), *trans*-Ph<sub>2</sub>TeF<sub>4</sub> (0.23 mmol) and CHCl<sub>3</sub> (1 mL) was kept in a sealed tube for 5 days at 20°C during which time the solution turned dark yellow and crystals of Me<sub>2</sub>NH·HF formed. The latter were removed and the <sup>19</sup>F NMR spectra (Table 1) of the solution showed two AB<sub>2</sub> spectra assigned to two isomers of Ph<sub>2</sub>TeF<sub>3</sub>NMe<sub>2</sub>, 4a and 4b.

Preparation of Ph<sub>3</sub>TeF<sub>2</sub>OMe 6

MeOH (0.89 mmol), NaF (2.8 mmol) and *mer*-Ph<sub>3</sub>TeF<sub>3</sub> (0.41 mmol) in CHCl<sub>3</sub> (3 mL) was kept in a sealed tube at 20°C for 3 days, and then heated to 45°C for 30 min. The solution was filtered and the filtrate dried under vacuum to give a white solid identified as Ph<sub>3</sub>TeF<sub>2</sub>OMe 6.

Preparation of Ph<sub>3</sub>TeF<sub>2</sub>NMe<sub>2</sub> 7

Me<sub>2</sub>NH (0.52 mmol), *mer*-Ph<sub>3</sub>TeF<sub>3</sub> (0.28 mmol) and CHCl<sub>3</sub> (3 mL) was kept at 20°C for 5 days and then heated to 40°C for 20 min. Solid Me<sub>2</sub>NH·HF was removed from the yellow solution which contained Ph<sub>3</sub>TeF<sub>2</sub>NMe<sub>2</sub> 7.

Trans-Ph<sub>2</sub>TeF<sub>4</sub> and cis-Ph<sub>2</sub>TeF<sub>4</sub> 8

Solid XeF<sub>2</sub> (0.12 g, 0.70 mmol) was added to a stirred solution of Ph<sub>2</sub>TeF<sub>2</sub> (0.16 g, 0.48 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (4 mL) at 0°C. After stirring for 2 days at 25°C, all volatile material was pumped off to give a white solid which was recrystallized from benzene/n-hexane and identified as *trans*-Ph<sub>2</sub>TeF<sub>4</sub> by <sup>19</sup>F and <sup>125</sup>Te NMR [1].

*Trans*-Ph<sub>2</sub>TeF<sub>4</sub> was also prepared in a one-step reaction by using an excess of XeF<sub>2</sub> (0.12 g, 0.70 mmol) and Ph<sub>2</sub>Te (0.08 g, 0.27 mmol) in CH<sub>2</sub>Cl<sub>2</sub>. It was also recovered from the reaction of XeF<sub>2</sub> and Ph<sub>3</sub>Te<sup>+</sup>BF<sub>4</sub><sup>-</sup> in CH<sub>2</sub>Cl<sub>2</sub>/CH<sub>3</sub>CN.

The synthesis of *trans*-Ph<sub>2</sub>TeF<sub>4</sub> was occasionally accompanied by the formation of small amounts (1-4%) of *cis*-Ph<sub>2</sub>TeF<sub>4</sub> 8, identified by its A<sub>2</sub>B<sub>2</sub> <sup>19</sup>F NMR spectrum (Table 1). Attempts to isolate *cis*-Ph<sub>2</sub>TeF<sub>4</sub> were unsuccessful.
