# Han Chinese Population Data for Ten STR Loci in Changsha, China

**POPULATIONS:** Han Chinese in Changsha,  $N = 108$

**KEYWORDS:** forensic science, DNA typing, population genetics, polymerase chain reaction, short tandem repeat, Chinese, D3S1358, D2S1338, D16S539, D18S51, D19S433, D21S11, vWA, D8S1179, TH01, FGA

Whole blood obtained by venipuncture was collected in EDTA vacutainer tubes from unrelated individuals residing in Changsha, China. The DNA was extracted by phenol chloroform method (1). PCR amplification was performed using the AmpF $\ell$ STR Profiler Plus<sup>TM</sup> PCR amplification kit (PE-Biosystems, Foster City, CA) following the manufacturer's protocol (2). The amplified products

were separated and detected using the ABI Prism<sup>TM</sup> 377 DNA sequencer (PE-Biosystems, Foster City, CA). The data were analyzed using The Promega Software, POWERSTATS.

Summary data for the ten loci are shown in Table 1. The complete data are available to any interested researcher upon request by contacting Kun Xia via e-mail: nlmglcy@public.cs.hn.cn. All loci, except TH01, meet Hardy-Weinberg expectations.
