# Allele Frequencies for Eight STR Loci in a Population Sample from Sicily (Italy)

**REFERENCE:** Asmundo A, Sapienza D, Crinò C. Allele frequencies for eight STR loci in a population sample from Sicily (Italy). *J Forensic Sci* 2001;47(2):408-409.

**POPULATION:** province of Messina (Sicily)

**KEYWORDS:** forensic science, DNA typing, short tandem repeat, population genetics, Sicily, D13S317, D7S820, D16S539, D3S1358, TPOX, CSF1PO, FGA and CD4

Blood samples from healthy and unrelated individuals ( $n=135-150$ ) were extracted by Chelex 100 procedure (1). DNA samples (5–25 ng) were amplified in a “PCR sprint” (Hybaid) thermal cycler and typed-classified according to the DNA commission of the ISFH (2). Allele and genotype frequencies were determined and Hardy-Weinberg equilibrium was tested by  $\chi^2$  method. From the genotype data, the power of discrimination (PD) according to the equation suggested by Fisher (3) was calculated. The heterozygosity value (OH) as described by Nei and Roychoudhury (4) was determined.

<sup>2</sup> Dipartimento di Medicina Sociale del Territorio (D.M.S.T.), Sezione di Medicina del Lavoro; Università degli Studi di Messina, Italy.

The allele frequencies of D13S317, D7S820, D16S539, D3S1358, FGA, and CD4 loci are given in Table 1.

The complete data are available to any interested researcher upon request to the corresponding author, Alessio Asmundo, M.D.
