D1S80 Population Data in Eight Predominant Populations of India*

POPULATION: Studied populations are Indo-Caucasian represented by Baniya (Bihar), Deshast Brahmin (Maharastra), Bengalee Kayastha (W.Bengal), Mixed Punjabi (Punjab), Indo Mongoloids represented by Kuki and Hmar (Manipur), Indo Proto-Australoid Ekere and a mixture of Proto-Australoid and Indo-Caucasian Reddy (Andhra Pradesh).

KEYWORDS: forensic science, Indo-Caucasian, Indo-Mongoloid, Proto-Australoid, D1S80, HWE, genetic database

DNA Extraction: From blood by phenol chloroform method (1), from buccal swab by chelex method (Bio-rad chelex 100 resin).

PCR: 2.5 ng target DNA following manufacturer's instructions (2).

Typing: By silver staining based allele detection on p. 3.

Result: See Table 1.

Quality Control: Laboratory Internal Control Standards and Kit controls.

Access of data: Via electronic mail from communicating author.

Analysis of data: DNA TYPE (Windows 98/NT version Y.Zhong, CHG, University of Texas). PE & PD (4).

Other remarks: D1S80 Alleles 14 and 15 are absent in most of the important world populations (U.S., Caucasian, and African-American), but were observed in Dehshast Brahmin among studied Indian populations. The allele 14 is the most rare allele among all alleles for Indian population groups. The maximum allele occur-

rence among the Indian populations was slightly different compared to published data of other world populations. Tests for independence for the alleles within a locus revealed no deviation from expected values for the eight populations of this study. The product of allele frequencies derived from the data can be used in forensic analysis and paternity tests to estimate the frequency of a D1S80 genotype.
