Autosomal Microsatellite Profile of Three Socially Diverse Ethnic Tamil Populations of India*

POPULATION: Three endogamous populations: Kongu Vellala Gounder, a socially progressive community, Irular, a tribal community and Chakkiliyar, a socially backward caste all residing around Coimbatore in the state of Tamil Nadu, India.

KEYWORDS: forensic science, human identification, DNA profiling, short tandem repeats, D3S1358, TH01, D21S11, D18S51, Penta E, D5S818, D13S317, D7S820, D16S539, CSF1P0, Penta D, vWA, D8S1179, TPOX, FGA, population genetics, India, Tamil Nadu, Kongu Vellala Gounder, Irular, Chakkiliyar

Blood samples were obtained by venipuncture from random, consenting individuals of the three populations: Kongu Vellala Gounder (56), Irular (54), and Chakkiliyar (49). DNA was isolated using standard phenol/chloroform procedure (1). Fifteen autosomal microsatellite loci were amplified using the PowerPlex[®] 16 system (Promega Corporation, Madison) according to manufacturer's recommendations (2). The amplified products were separated by denaturing gel electrophoresis using the ABI PrismTM 377 DNA Sequencer (PE Applied Biosystems, Foster City, CA). Alleles were determined by comparison with the allelic ladder included in the kit.

The resultant data were analyzed using DNATYPE program (3). The genotype frequencies, results of Hardy-Weinberg tests, combined probability of match, the observed and expected heterozygosity values obtained in the three Tamil populations are given in Tables 1–3. The study contributes three new populations to the database being created for the Indian population groups (4–8).

The complete data set is available to any interested researcher upon request.

* DNA Typing Unit, Central Forensic Science Laboratory, 30 Gorachand Road, Kolkata 700014, West Bengal, India.

† Supported by a grant from BPR&D, MHA, Govt. of India.

‡ Assisted with a fellowship from Council of Scientific & Industrial Research (CSIR), India.
