Paraguayan Population Data on the Fifteen STR Loci Included in the POWERPLEX 16™ Kit

POPULATION: Paraguay, South America

KEYWORDS: forensic science, DNA typing, population genetics, Paraguay, South America

Blood samples were obtained by venipuncture from unrelated individuals ($n = 168$) living in Paraguay.

Approximately 1 ng of DNA were used in each amplification. The samples were amplified using the PowerPlex 16™ kit (Promega) and the alleles were separated and detected using an Applied Biosystems ABI310 genetic analyzer.

The frequency of each allele for each locus was calculated from the numbers of each genotype in the sample set (i.e., the gene count method). Unbiased estimates of expected heterozygosity were computed as described by Edwards et al. (1) Possible divergence from Hardy-Weinberg expectations (HWE) was tested by calculating the unbiased estimate of the expected homozygote/heterozygote frequencies (1–4) and the exact test (5) based on 2000 shufflings experiments. An interclass correlation criterion (6) for two-locus associations was used for detecting disequilibrium between the STR loci. The program for this analysis was kindly provided by R. Chakraborty (University of Texas, School of Biomedical Sciences, Houston, Texas).

The distributions of the observed allele frequencies for the 15 STR loci are shown in Table 1. The most informative loci are FGA and Penta E, and the least discriminating are TPOX and D5S818 (Table 2). The 15 loci meet Hardy-Weinberg expectations. There is little evidence for association of alleles between pairs of the 15 loci. Only five (FGA/D18S51; $p = 0.033$; D8S1179/D13S317; $p = 0.006$; D5S818/CSF1PO; $p = 0.010$; TH01/PentaE; $p = 0.028$; CSF1PO/PentaD; $p = 0.004$) of 105 pairwise comparisons demonstrated a departure from expectations of independence. This number of departures is within expectations of departure by chance and

these five departures are not significant after correction for sampling (i.e., Bonferroni (7)). The combined power of discrimination is >0.9999999 , and the combined power of exclusion is 0.99999944. The complete data are available by accessing <http://www.gitad.org/poblaciones>.

Acknowledgments

This study was supported by the “Fundacion M. Botin, Santander, Spain). We thank Promega Corp. for kindly providing the PowerPlex16 kit.
