A Peruvian Population Study of Eight Y-Chromosome STR Loci

POPULATION: We have analyzed the distribution of the allele frequencies and haplotypes at eight Y-chromosomal short tandem repeat (STR) loci (DYS437, DYS438, DYS439, DYS460, DYS461, GATA A10, GATA C4 and GATA H4) in a sample population of 87 unrelated individuals from Perú.

KEYWORDS: forensic science, DNA typing, population genetics, Y-chromosome, STR, DYS437, DYS438, DYS439, DYS460, DYS461, GATA A10, GATA C4 and GATA H4, Perú

Blood samples from 87 unrelated individuals from Perú were collected. DNA was extracted of FTA Cards using FTA purification reagent. The primer sequences of loci and cycling conditions were as recommended (1–3). The eight loci were amplified in two multiplexes. Multiplex I includes four STR: GATA-C4, DYS438, DYS437 and DYS461. Multiplex II includes: GATA-H4, DYS439, GATA-A10 and DYS460. PCR conditions were as follows: 5 ng DNA in 15 µl total reaction volume containing 2 mM MgCl₂, 1X PCR Taq DNA Polimerasa buffer, 0.5 U Taq DNA Polymerase (Promega), 200 µM of each dNTP, 0.53 µM GATA-C4 primers, 1.6 µM DYS438 primers, 0.8 µM DYS437 primers, 1.6 µM DYS461 primers, 0.8 µM GATA-H4 primers, 0.67 µM DYS439 primers, 0.53 µM GATA-A10 primers and 1.06 µM DYS460 primers. After a 3 min a 95°C pre-incubation, a total of 35 cycles were carried out in a PTC-100 (MJ-Research) PCR System, denaturation for 30 s at 94°C, annealing for 20 s at 60°C and extension for 30 s at 70°C, followed by a 45 min final extension at 70°C. The PCR products were analyzed using denaturing 4% acrylamide-bis-acrilamide gel electrophoresis and detected by silver staining. Alleles were identified based on the number of repeats and their attribution was made by comparison with an in-house constructed allelic ladder and following the published nomenclature (3) and ISFG guidelines for STR analysis (4). Correct allele calling was additionally assured by successful participation in the quality control test of the GEP-ISFG. The gene frequencies and gene or haplotype diversity values were calculated using the software ARLEQUIN version 2000 (5) and Nei formulation (6), the discrimination capacity was the percentage proportion of the different haplotypes.

Table 1 summarizes the allele frequency distribution and gene diversity for each locus. The most frequent haplotypes observed, the haplotype diversity and discrimination capacity are presented in Table 2. Complete data are available at the e-mail address of the corresponding author upon request.
