

EDITORIAL

Continuing our policy of concentrating papers on particular subjects within one issue, this issue is devoted exclusively to papers concerned with the compatibility of plastics and other materials with explosives, propellants and pyrotechnics. The contributions have been selected from those presented at a symposium held by the American Defence Preparedness Association in November 1977. We are grateful to the organisation committee under the chairmanship of Lester R. Bartron for permission to publish the papers and thereby permit them to have a wider distribution.
