The title compound **3** was prepared in six steps from 5-nitro-8-hydroxyquinoline in 14% overall yield, using a substituted pyrimidine as a protecting group for sulfur. This offers a simple entry into the synthesis of 5-carboxy-8-substituted thioquinolines, useful intermediates for the synthesis of H⁺,K⁺-ATPase inhibitors.

J. Heterocyclic Chem., **28**, 657 (1991).

We have had a long-standing interest in gastrointestinal agents, most recently H⁺,K⁺-ATPase inhibitors [1]. Agents such as omeprazole (**1**) [2,3] are able to significantly reduce stomach acid production by irreversibly inhibiting H⁺,K⁺-ATPase, the 'proton pump' which is responsible for the terminal step in gastric acid secretion. Although ulcer healing rates with this class of inhibitors are significantly faster than with other therapies, irreversible inhibition leads to prolonged achlorhydria, which may lead to serious side effects. It was our intention, therefore, to develop structurally novel, reversible inhibitors of H⁺,K⁺-ATPase. A reversible inhibitor would be expected to have a shorter duration of action and thus not promote prolonged achlorhydria upon chronic dosing.

Figure 1

In an attempt to find replacements for the benzimidazole and pyridine moieties of omeprazole, we discovered a series of compounds, pyrimidine-quinoline sulfoxides **2**, which inhibited H⁺,K⁺-ATPase [4]. Structure activity relationships (SAR) suggested that we pursue quinolines with electron withdrawing groups in the 5-position, including the analogs in which the 5-position contained a carboxylic acid, ester or nitrile. Although the corresponding 8-oxygen substituted quinolines with 5-nitrile [5] or 5-carboxyl [6]

Figure 2

had been reported, no published reports of the corresponding 8-sulfur analogs had been found. We wish to report here the synthesis of a number of mercaptoquinoline derivatives, utilizing the previously unknown species 5-carboxy-8-mercaptoquinoline hydrochloride (**3**). We will also present some additional related chemistry of this molecule.

The route we followed to synthesize **3** is shown in Scheme I. 5-Nitro-8-tosylquinoline (**4**) was prepared from 8-hydroxy-5-nitroquinoline and tosyl chloride in 98% yield. Reaction of **4** with 2-mercapto-4-methylpyrimidine hydrochloride gave compound **5** in 86% yield. Initial attempts to reduce the nitro group with stannous chloride in concentrated hydrochloric acid produced mixtures of the desired amine **6**, unreacted starting material **5** and 5-

Scheme I

amino-8-mercaptoquinoline, whereas reduction with zinc in acetic acid gave amine **6** in 94% yield. Treatment of the amine with tetrafluoroboric acid and sodium nitrite yielded the stable diazonium salt **7** in 61% yield. The modified Sandmeyer reaction [7] of this diazonium salt **7** with sodium cyanide and copper cyanide in dimethyl sulfoxide gave the nitrile **8** in 52% yield. Hydrolysis of the nitrile and pyrimidine group with 6*N* hydrochloric acid gave **3** which slowly crystallized out of the reaction mixture in 54% yield. Thus, **3** was obtained in six steps in an overall yield of 14%.

We had originally intended to introduce the sulfur and appropriately substituted pyrimidine early in the synthesis of each target inhibitor and then carry out the transformations at the 5-position, as shown. However, in our first example, where the pyrimidine contained a methyl group in the 4-position, hydrolysis of **8** with 6*N* hydrochloric acid gave compound **3**, where the carboxylic acid was obtained at the 5-position, and the 4-methylpyrimidine was removed at the 8-position to give SH. In effect, the 4-methylpyrimidine moiety acted as a protecting group for sulfur while the transformations at the 5-position were carried through to the carboxylic acid. For our purposes this proved useful in that **3** was a common intermediate that could be coupled with substituted 2-chloropyrimidines to easily give the desired pyrimidine-quinoline sulfides (and ultimately the sulfoxides), thus eliminating the need to carry the different pyrimidines through each step from compound **4**. We are currently investigating the utility of 4-methylpyrimidine as a general protecting group for sulfur.

Scheme II

To complete the syntheses of the desired H⁺,K⁺-ATPase inhibitors, **3** was reacted with a number of substituted 2-chloropyrimidines in the presence of 1,5-diazabicyclo-[4.3.0]non-5-ene to give the sulfide analogs **9a-11a** (Scheme II). However, these carboxylic acid products could not easily be obtained in a pure form since they were associated with excess amounts of base. Therefore, the pure methyl esters **9b-11b** were prepared by reaction of the carboxylic acids with diazomethane. Small amounts of concentrated hydrochloric acid were added to the reaction mixtures to liberate the free carboxylic acids before the addition of the diazomethane, and large excesses of diazomethane were used to ensure complete esterification in the presence of any excess hydrochloric acid. Oxidation with *m*-chloroperbenzoic acid gave the targets **9c-11c**.

In an investigation separate from our H⁺,K⁺-ATPase inhibitor work, the reaction of **3** with a number of more common electrophiles in the presence of 1,5-diazabicyclo-[4.3.0]non-5-ene all gave the expected sulfides **12a-17a** in good to excellent yields (Scheme III). As in the above cases, the pure methyl esters **12b-17b** were prepared with diazomethane.

Scheme III

In conclusion, several novel H⁺,K⁺-ATPase inhibitors were prepared, which featured a unique quinoline substitution pattern. These compounds exhibited activity that was comparable to that of omeprazole [4]. In the course of their syntheses, 4-methylpyrimidine was employed as a protecting group for sulfur, which when removed, gave the intermediate **3**, from which the sulfoxides of interest could be easily prepared.

EXPERIMENTAL

Melting points were determined on a Thomas-Hoover capillary

melting point apparatus and are uncorrected. The ¹H nmr and ¹³C nmr spectra were recorded on either a Varian XL-300 or a Bruker WM-250 instrument. Chemical shifts are expressed in ppm relative to internal deuteriodimethyl sulfoxide or deuteriochloroform. Infrared spectra were taken in potassium bromide pellets with a Perkin-Elmer 283B infrared spectrometer. Low resolution mass spectra were recorded on a Finnigan 4510 GC mass spectrometer. Elemental analyses were determined by Pfizer's Central Research Analytical Department.

The solvents and reagents used were commercially available and used directly without further purification. All reactions were monitored by thin-layer chromatography on 0.25 mm x 5 cm x 10 cm silica gel 60 GF-254 (Merck) plates using uv light for visualization. Flash chromatography was performed using 32-63 μm silica gel (Woelm) according to the method of Still *et al.* [8].

5-Nitro-8-tosylquinoline (4).

This was prepared from 5-nitro-8-hydroxyquinoline and tosyl chloride according to the procedure of Debat, *et al.* [9], mp 130-131°; ¹H nmr (deuteriodimethyl sulfoxide): δ 8.95 (dd, J = 5 Hz, J = 1 Hz, 1H, quinoline H₂), 8.82 (dd, J = 8 Hz, J = 1 Hz, 1H, quinoline H₄), 8.47 (d, J = 9 Hz, 1H, quinoline H₆), 7.82 (d, J = 9 Hz, 2H, phenyl H₂, H₆), 7.81 (dd, J = 8 Hz, J = 5 Hz, 1H, quinoline H₃), 7.70 (d, J = 9 Hz, 1H, quinoline H₇), 7.41 (d, J = 9 Hz, 2H, phenyl H₃, H₅), 2.37 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 161.6 (quinoline C₈), 152.2 (quinoline C₂), 148.8 (quinoline C₅), 146.0 (phenyl C₄), 143.6 (phenyl C₁), 140.5 (quinoline C₉), 131.9 (quinoline C₄), 130.1 (phenyl C₃, C₅), 128.4 (phenyl C₂, C₆), 125.2 (quinoline C₆), 125.0 (quinoline C₃), 121.9 (quinoline C₁₀), 120.8 (quinoline C₇), 21.2 (CH₃); ir (potassium bromide): 1530 (NO₂ asymmetric stretch), 1375 (SO₂ asymmetric stretch), 1340 (NO₂ symmetric stretch), 1180 (SO₂ symmetric stretch) cm⁻¹; ms: m/e (relative intensity) 280 (M⁺-SO₂, 18), 233 (5), 155 (41), 115 (7), 91 (100), 65 (18); high resolution ms: Calcd. for C₁₆H₁₂N₂O₃ (M⁺-SO₂) m/e 280.0848. Found: m/e 280.0880.

Anal. Calcd. for C₁₆H₁₂N₂O₃S: C, 55.81; H, 3.51; N, 8.14. Found: C, 55.87; H, 3.45; N, 8.06.

4-Methyl-2-[(5-nitro-8-quinolyl)thio]pyrimidine (5).

Triethylamine (17.6 g, 174 mmoles) was added to a suspension of **4** (30.0 g, 87.1 mmoles) and 2-mercapto-4-methylpyrimidine hydrochloride (14.2 g, 87.2 mmoles) in dimethylformamide (400 ml) at room temperature under nitrogen. The resulting solution was stirred at room temperature for 23 hours, then diluted with water (600 ml). The solid that separated was collected, washed with water (50 ml) and dried to give 48.35 g of crude material. This was dissolved in chloroform (1200 ml), and the organic solution was washed first with 1 M aqueous sodium hydroxide solution (1200 ml), then water (1200 ml), dried over anhydrous magnesium sulfate, and evaporated *in vacuo* to give 26.99 g of crude yellow solid. Repeated purification by flash chromatography, eluting with chloroform gave 22.46 g (86% yield) of yellow solid. A portion (0.500 g) was recrystallized from carbon tetrachloride (100 ml) to give 0.284 g (57% recovery) of yellow solid, mp 169-170°; ¹H nmr (deuteriochloroform): δ 9.04 (dd, J = 9 Hz, J = 2 Hz, 1H, quinoline H₄), 8.97 (dd, J = 4 Hz, J = 2 Hz, 1H, quinoline H₂), 8.43 (d, J = 8 Hz, 1H, quinoline H₆), 8.35 (d, J = 6 Hz, 1H, pyrimidine H₆), 8.34 (d, J = 8 Hz, 1H, quinoline H₇), 7.65 (dd, J = 9 Hz, J = 4 Hz, 1H, quinoline H₃), 6.94 (d, J = 6 Hz, 1H, pyrimidine H₅), 2.45 (s, 3H, CH₃); ¹³C nmr (deuteriochloroform): δ

169.5 (pyrimidine C₂), 168.6 (pyrimidine C₄), 157.0 (pyrimidine C₆), 150.7 (quinoline C₂), 145.9 (quinoline C₅), 144.5 (quinoline C₈), 141.7 (quinoline C₆), 132.9 (quinoline C₄), 130.6 (quinoline C₆), 124.6 (quinoline C₇), 124.5 (quinoline C₃), 121.4 (quinoline C₁₀), 118.1 (pyrimidine C₅), 24.1 (CH₃); ir (potassium bromide): 1560 (NO₂ asymmetric stretch), 1325 (NO₂ symmetric stretch) cm⁻¹; ms: m/e (relative intensity) 298 (M⁺, 100), 283 (3), 265 (16), 252 (23), 251 (23), 240 (9), 206 (11), 174 (69), 159 (11), 128 (40), 126 (18), 114 (10), 66 (12); high resolution ms: Calcd. for C₁₄H₁₀N₄SO₂ m/e 298.0524. Found: m/e 298.0507.

Anal. Calcd. for C₁₄H₁₀N₄SO₂: C, 56.36; H, 3.38; N, 18.78. Found: C, 56.08; H, 3.23; N, 18.61.

4-Methyl-2-[(5-amino-8-quinolyl)thio]pyrimidine (6).

Zinc dust (21.00 g, 321.2 mmoles) was added in portions to a suspension of **5** (21.1 g, 70.8 mmoles) in glacial acetic acid (850 ml) at room temperature. The brown suspension was stirred at room temperature for 1 hour, then poured slowly with stirring into an ice-cold solution of 5 M aqueous potassium hydroxide (3400 ml). The solid that separated was collected then triturated with methylene chloride (3 x 3000 ml). All of the organic extracts were combined and evaporated *in vacuo* to give 17.87 g (94% yield) of brown solid. A portion (0.71 g) was purified by flash chromatography, eluting with ethyl acetate to give 0.50 g (70% recovery) of orange solid which was then recrystallized from carbon tetrachloride (2200 ml) to give 0.149 g (30% recovery) of orange solid, mp 172-175°; ¹H nmr (deuteriodimethyl sulfoxide): δ 8.75 (dd, J = 4 Hz, J = 1 Hz, 1H, quinoline H₂), 8.57 (dd, J = 4 Hz, J = 1 Hz, 1H, quinoline H₄), 8.17 (d, J = 5 Hz, 1H, pyrimidine H₆), 7.75 (d, J = 8 Hz, 1H, quinoline H₇), 7.38 (dd, J = 8 Hz, J = 4 Hz, 1H, quinoline H₃), 6.93 (d, J = 5 Hz, 1H, pyrimidine H₅), 6.73 (d, J = 8 Hz, 1H, quinoline H₆), 6.45 (s, 2H, NH₂), 2.28 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 171.4 (pyrimidine C₂), 167.3 (pyrimidine C₄), 157.1 (pyrimidine C₆), 148.8 (quinoline C₅), 148.4 (quinoline C₂), 145.4 (quinoline C₈), 141.6 (quinoline C₇), 141.6 (quinoline C₉), 136.1 (quinoline C₄), 118.9 (quinoline C₃), 118.7 (quinoline C₁₀), 116.8 (pyrimidine C₅), 108.2 (quinoline C₆), 23.4 (CH₃); ir (potassium bromide): 3410-3250 (asymmetric NH stretch), 3250-3050 (symmetric NH stretch), 1560 (NH bend) cm⁻¹; ms: m/e (relative intensity) 268 (M⁺, 100), 253 (4), 235 (45), 210 (17), 175 (11), 144 (89), 131 (36), 117 (9); high resolution ms: Calcd. for C₁₄H₁₂N₄S m/e 268.0783. Found: m/e 268.0752.

4-Methyl-2-[(5-diazoniumtetrafluoroboro-8-quinolyl)thio]pyrimidine (7).

A solution of sodium nitrite (4.53 g, 65.7 mmoles) in water (100 ml) was added dropwise with stirring to a solution of **6** (17.4 g, 64.9 mmoles) in water (100 ml) and 48% tetrafluoroboric acid (142 ml) at 0°. After stirring at 0° for 30 minutes, the solid that separated was collected, washed with water (200 ml), then ether (200 ml) and dried to give 14.46 g (61% yield) of brown solid, mp 129°; ¹H nmr (deuteriodimethyl sulfoxide): δ 9.25 (dd, J = 5 Hz, J = 2 Hz, 1H, quinoline H₂), 9.10 (d, J = 9 Hz, 1H, quinoline H₆), 8.98 (dd, J = 9 Hz, J = 2 Hz, 1H, quinoline H₄), 8.81 (d, J = 9 Hz, 1H, quinoline H₇), 8.73 (d, J = 5 Hz, 1H, pyrimidine H₆), 8.15 (dd, J = 9 Hz, J = 5 Hz, 1H, quinoline H₃), 7.47 (d, J = 5 Hz, 1H, pyrimidine H₅), 2.53 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 169.4 (pyrimidine C₂), 165.6 (pyrimidine C₄), 158.4

(pyrimidine C₆), 154.7 (quinoline C₅), 153.2 (quinoline C₂), 142.6 (quinoline C₉), 136.3 (quinoline C₆), 132.3 (quinoline C₄), 127.6 (quinoline C₇), 126.8 (quinoline C₃), 123.3 (quinoline C₈), 120.3 (pyrimidine C₅), 106.9 (quinoline C₁₀), 23.6 (CH₃); ir (potassium bromide): 2220 (N=N stretch) cm⁻¹; ms: m/e (relative intensity) 271 (M⁺-N₂, BF₃, 54), 238 (20), 213 (14), 179 (12), 147 (100), 134 (32), 120 (17), 107 (14), 67 (24), 61 (61); high resolution ms: Calcd. for C₁₄H₁₀FN₃S (M⁺-N₂, BF₃) m/e 271.0580. Found: m/e 271.0586.

4-Methyl-2-[(5-cyano-8-quinolyl)thio]pyrimidine (**8**).

Cuprous cyanide (17.69 g, 197.5 mmoles) and sodium cyanide (12.61 g, 257.2 mmoles) were mixed with dimethyl sulfoxide (175 ml), and the resulting viscous resin gradually dissolved after stirring overnight. Powdered **7** (14.5 g, 39.5 mmoles) was added in small portions with stirring, keeping the temperature of the reaction mixture at 20°. After 10 minutes the reaction mixture was diluted with water (220 ml), and the resulting suspension was extracted with ethyl acetate (7 x 300 ml). The combined organic extracts were dried over anhydrous magnesium sulfate, then evaporated *in vacuo* to give 26.06 g of crude brown solid. Repeated purification by flash chromatography, eluting with ethyl acetate gave 5.71 g (52% yield) of yellow solid. A portion (0.300 g) was recrystallized from hexane (300 ml) to give 0.250 g (83% recovery) of yellow solid, mp 127-128°; ¹H nmr (deuteriodimethyl sulfoxide): δ 9.04 (dd, J = 4 Hz, J = 2 Hz, 1H, quinoline H₂), 8.51 (dd, J = 9 Hz, J = 2 Hz, 1H, quinoline H₄), 8.45 (d, J = 8 Hz, 1H, quinoline H₆), 8.44 (d, J = 5 Hz, 1H, pyrimidine H₆), 8.23 (d, J = 8 Hz, 1H, quinoline H₇), 7.82 (dd, J = 9 Hz, J = 4 Hz, 1H, quinoline H₃), 7.19 (d, J = 5 Hz, 1H, pyrimidine H₅), 2.39 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 168.7 (pyrimidine C₂), 168.1 (pyrimidine C₄), 157.5 (pyrimidine C₆), 151.6 (quinoline C₂), 144.8 (quinoline C₉), 139.3 (quinoline C₈), 133.5 (quinoline C₄), 133.1 (quinoline C₇), 131.6 (quinoline C₅), 127.1 (quinoline C₁₀), 124.4 (quinoline C₃), 118.2 (pyrimidine C₅), 116.4 (CN), 108.5 (quinoline C₅), 23.5 (CH₃); ir (potassium bromide): 2300 (C≡N stretch) cm⁻¹; ms: m/e (relative intensity) 278 (M⁺, 68), 263 (4), 245 (16), 220 (13), 186 (14), 185 (14), 154 (100), 141 (17), 127 (11), 123 (10), 114 (18), 66 (13); high resolution ms: Calcd. for C₁₅H₁₀N₄S m/e 278.0626. Found: m/e 278.0594.

Anal. Calcd. for C₁₅H₁₀N₄S: C, 64.73; H, 3.62; N, 20.13. Found: C, 64.60; H, 3.42; N, 20.16.

5-Carboxy-8-mercaptoquinoline Hydrochloride Monohydrate (**3**).

A solution of **8** (1.3 g, 4.7 mmoles) in 6*N* hydrochloric acid (150 ml) was refluxed for 6 hours, then cooled. After standing at room temperature for 2 days, the solid that separated was collected and dried to give 0.61 g (54% yield) of yellow solid, mp 188-189°; ¹H nmr (deuteriodimethyl sulfoxide): δ 9.40 (dd, J = 9 Hz, J = 3 Hz, 1H, quinoline H₄), 9.06 (dd, J = 4 Hz, J = 3 Hz, 1H, quinoline H₂), 8.18 (d, J = 8 Hz, 1H, quinoline H₆), 7.81 (dd, J = 9 Hz, J = 4 Hz, 1H, quinoline H₃), 7.78 (d, J = 8 Hz, 1H, quinoline H₇); ¹³C nmr (deuteriodimethyl sulfoxide): δ 167.2 (CO₂), 149.8 (quinoline C₂), 144.9 (quinoline C₉), 140.6 (quinoline C₈), 134.8 (quinoline C₄), 130.9 (quinoline C₆), 126.3 (quinoline C₁₀), 124.9 (quinoline C₅), 123.6 (quinoline C₃), 122.7 (quinoline C₇); ir (potassium bromide) 3100-2500 (OH stretch), 1685 (C=O stretch) cm⁻¹; ms: m/e (relative intensity) 205 (M⁺, 100), 188 (12), 161 (38), 117 (14), 91 (12); high resolution ms: Calcd. for C₁₀H₇NO₂S m/e 205.0198. General Procedure For The Addition of Halides To **3** To Give Sulfides **9a-18a**.

1,5-Diazabicyclo[4.3.0]non-5-ene was added dropwise to a solution of **3** and the halide in methanol. The reaction mixture was stirred at room temperature under nitrogen for 2 hours, then concentrated *in vacuo* to give the crude product, which was purified by flash chromatography.

General Procedure For The Preparation of Methyl Esters **9b-17b** With Diazomethane.

Concentrated hydrochloric acid was added to a solution of the acid in methanol and ethyl acetate and this solution was cooled at 0°. About 1/3 of a dry ether solution of diazomethane prepared from *N*-methyl-*N*'-nitro-*N*-nitrosoguanidine [10] was added with stirring. After 5 minutes, additional concentrated hydrochloric acid was added and an additional 1/3 of the ether solution of diazomethane was added with stirring. After 5 minutes, additional concentrated hydrochloric acid was added and the final 1/3 of the ether solution of diazomethane was added with stirring. After stirring for 5 minutes, the reaction mixture was quenched by the addition of 7*M* aqueous acetic acid then evaporated *in vacuo* to give the crude product, which was purified by flash chromatography and recrystallization.

General Procedure For The Preparation of Sulfoxides **9c-11c** With *m*-Chloroperbenzoic Acid.

m-Chloroperbenzoic acid was added to a suspension of sodium bicarbonate and the sulfide in anhydrous tetrahydrofuran at 0° under nitrogen. The reaction was stirred at 0° for 15 minutes, then warmed to room temperature and stirred for 1 hour, then concentrated *in vacuo* to give the crude product, which was purified by flash chromatography.

4-Methoxy-5-methyl-2-[(5-carboxy-8-quinolyl)thio]pyrimidine (**9a**).

1,5-Diazabicyclo[4.3.0]non-5-ene (0.62 g, 5.0 mmoles), **3** (0.30 g, 1.2 mmoles) and 2-chloro-4-methoxy-5-methylpyrimidine (0.21 g, 1.3 mmoles) were reacted in methanol (75 ml) to give 1.115 g of yellow oil which was purified by flash chromatography, eluting with 3:7 methanol:ethyl acetate to give 0.459 g (100% yield) of yellow solid, mp 210-212°; ¹H nmr (deuteriodimethyl sulfoxide): δ 9.37 (dd, J = 9 Hz, J = 2 Hz, 1H, quinoline H₄), 8.91 (dd, J = 4 Hz, J = 2 Hz, 1H, quinoline H₂), 8.33 (d, J = 8 Hz, 1H, quinoline H₆), 8.19 (d, J = 8 Hz, 1H, quinoline H₇), 8.16 (s, 1H, pyrimidine H₆), 7.66 (dd, J = 9 Hz, J = 4 Hz, 1H, quinoline H₃), 3.66 (s, 3H, OCH₃), 2.01 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 170.0 (pyrimidine C₂), 167.1 (CO₂), 166.4 (pyrimidine C₄), 156.9 (pyrimidine C₆), 150.0 (quinoline C₂), 146.0 (quinoline C₉), 138.6 (quinoline C₈), 135.0 (quinoline C₆), 132.1 (quinoline C₄), 129.5 (quinoline C₇), 127.4 (quinoline C₁₀), 126.6 (quinoline C₅), 122.8 (quinoline C₃), 114.4 (pyrimidine C₅), 53.8 (OCH₃), 11.9 (CH₃); ir (potassium bromide): 3250-2500 (OH stretch), 1660 (C=O stretch) cm⁻¹; ms: m/e (relative intensity) 327 (M⁺, 77), 326 (100), 312 (24), 294 (30), 253 (52), 219 (21), 205 (29), 186 (16), 173 (71), 132 (20), 128 (20), 83 (27), 55 (19); high resolution ms: Calcd. for C₁₆H₁₃N₃O₃S m/e 327.0680. Found: m/e 327.0662.

4-Methoxy-5-methyl-2-[(5-methoxycarbonyl-8-quinolyl)thio]pyrimidine (**9b**).

Concentrated hydrochloric acid (8 drops) was added to a solution of **9a** (0.41 g, 1.2 mmoles) in methanol (70 ml) and ethyl acetate (70 ml). The dry ether solution of diazomethane (total 31

mmoles) was added in thirds as described above. The reaction was quenched by the addition of 7M aqueous acetic acid (20 ml), then evaporated *in vacuo* to give 1.017 g of yellow solid which was purified by flash chromatography, eluting with ether to give 0.246 g (58% yield) of yellow solid, mp 173-174°; ¹H nmr (deuteriodimethyl sulfoxide): δ 9.24 (d, J = 9 Hz, 1H, quinoline H₄), 8.97 (d, J = 4 Hz, 1H, quinoline H₂), 8.41 (d, J = 8 Hz, 1H, quinoline H₆), 8.24 (d, J = 8 Hz, 1H, quinoline H₇), 8.21 (s, 1H, pyrimidine H₆), 7.73 (dd, J = 9 Hz, J = 4 Hz, 1H, quinoline H₃), 3.95 (s, 3H, ester CH₃), 3.70 (s, 3H, OCH₃), 2.03 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 167.2 (pyrimidine C₂), 166.2 (pyrimidine C₄), 165.9 (CO₂), 157.0 (pyrimidine C₆), 150.3 (quinoline C₂), 145.6 (quinoline C₉), 138.6 (quinoline C₈), 134.4 (quinoline C₆), 131.3 (quinoline C₄), 130.1 (quinoline C₇), 126.1 (quinoline C₁₀), 126.0 (quinoline C₅), 123.4 (quinoline C₃), 114.7 (pyrimidine C₅), 53.8 (OCH₃), 52.5 (ester CH₃), 11.9 (CH₃); ir (potassium bromide): 1690 (C=O stretch), 1255 (C-O-C asymmetric stretch), 1180 (C-O-C symmetric stretch) cm⁻¹; ms: m/e (relative intensity) 341 (M⁺, 73), 340 (100), 326 (27), 308 (28), 267 (49), 240 (15), 213 (13), 187 (61), 170 (16), 159 (27), 141 (19), 128 (19); high resolution ms: Calcd. for C₁₇H₁₅N₃O₃S m/e. Anal. Calcd. for C₁₄H₁₃NO₄S: C, 57.72; H, 4.50; N, 4.81. Found: C, 57.77; H, 4.27; N, 4.77.

5-Carboxy-8-methylthioquinoline (17a).

1,5-Diazabicyclo[4.3.0]non-5-ene (0.29 g, 2.3 mmoles), **3** (0.14 g, 0.6 mmole) and methyl iodide (0.08 g, 0.6 mmole) were reacted in methanol (40 ml) to give 0.503 g of yellow oil which was purified by flash chromatography, eluting with 1:4 methanol:ethyl acetate to give 0.198 g (100% yield) of yellow solid, mp 232-233°; ¹H nmr (deuteriodimethyl sulfoxide): δ 9.41 (dd, J = 11 Hz, J = 2 Hz, 1H, quinoline H₄), 8.92 (dd, J = 5 Hz, J = 2 Hz, 1H, quinoline H₂), 8.24 (d, J = 10 Hz, 1H, quinoline H₆), 7.70 (dd, J = 11 Hz, J = 5 Hz, 1H, quinoline H₃), 7.54 (d, J = 10 Hz, 1H, quinoline H₇), 2.54 (s, 3H, CH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 167.7 (CO₂), 148.9 (quinoline C₂), 146.9 (quinoline C₉), 144.4 (quinoline C₈), 134.5 (quinoline C₄), 130.7 (quinoline C₆), 125.9 (quinoline C₁₀), 123.0 (quinoline C₃), 122.6 (quinoline C₅), 121.2 (quinoline C₇), 13.4 (CH₃); ir (potassium bromide): 3600-2400 (OH stretch), 1660 (C=O stretch) cm⁻¹; ms: m/e (relative intensity) 219 (M⁺, 100), 186 (46), 173 (51), 158 (17), 144 (11), 128 (21); high resolution ms: Calcd. for C₁₁H₉NO₂S m/e 219.0354. Found: m/e 219.0350.

5-Methoxycarbonyl-8-methylthioquinoline (17b).

Concentrated hydrochloric acid (4 drops) was added to a solution of **17a** (0.15 g, 0.7 mmole) in methanol (25 ml) and ethyl acetate (25 ml). The dry ether solution of diazomethane (total 51.0 mmoles) was added in thirds as described above. The reaction was quenched by the addition of 7M aqueous acetic acid (15 ml), then evaporated *in vacuo* to give 0.412 g of yellow residue which was purified by flash chromatography, eluting with chloroform to give 0.080 g (50% yield) of yellow solid. This was recrystallized from hexane (10 ml) to give 0.063 g (79% recovery) of yellow solid, mp 127-128°; ¹H nmr (deuteriodimethyl

sulfoxide): δ 9.27 (dd, J = 9 Hz, J = 2 Hz, 1H, quinoline H₄), 8.93 (dd, J = 4 Hz, J = 2 Hz, 1H, quinoline H₂), 8.20 (d, J = 9 Hz, 1H, quinoline H₆), 7.72 (dd, J = 9 Hz, J = 4 Hz, 1H, quinoline H₃), 7.54 (d, J = 9 Hz, 1H, quinoline H₇), 3.91 (s, 3H, OCH₃), 2.53 (s, 3H, SCH₃); ¹³C nmr (deuteriodimethyl sulfoxide): δ 166.3 (CO₂), 149.1 (quinoline C₂), 147.9 (quinoline C₉), 144.3 (quinoline C₈), 134.1 (quinoline C₄), 130.7 (quinoline C₆), 125.6 (quinoline C₁₀), 123.4 (quinoline C₃), 121.2 (quinoline C₇), 121.0 (quinoline C₅), 52.0 (OCH₃), 13.4 (SCH₃); ir (potassium bromide): 1690 (C=O stretch), 1255 (C-O-C asymmetric stretch), 1180 (C-O-C symmetric stretch) cm⁻¹; ms: m/e (relative intensity) 233 (M⁺, 100), 218 (9), 200 (83), 187 (81), 172 (69), 156 (22), 141 (16), 128 (59), 115 (13), 101 (22), 87 (56), 75 (14), 69 (12), 45 (14); high resolution ms: Calcd. for C₁₂H₁₁NO₂S m/e 233.0511. Found: 233.0471.

Anal. Calcd. for C₁₂H₁₁NO₂S: C, 61.78; H, 4.75; N, 6.00. Found: C, 61.48; H, 4.55; N, 5.86.

Acknowledgement.

Thanks are due to Dr. Peter McCarthy and especially to Dr. Burton Goodman for many helpful discussions.
