Ethyl 3,4-dihydro-2H-1,4-benzoxazine-3-carboxylate derivatives 2 were obtained and isolated in low yields from the condensation of 2-aminophenol and ethyl 2,3-dibromopropanoate. They can be obtained by hydrogenation of ethyl $2 H$-1,4-benzoxazine-3-carboxylate in satisfactory yield. Using 2-iminophenol did not direct the condensation with ethyl 2,3-dibromopropanoate towards 2 but was fruitfull for the preparation of ethyl 2-(4-benzyl-3,4-dihydro-2H-1,4-benzoxazin-3-yl)acetate from ethyl bromocrotonate.
J. Heterocyclic Chem., 38, 221 (2001).

The 3,4-dihydro-2H-1,4-benzoxazine framework is often encountered in pharmacologically active compounds [1]. In our group we have developped inter alia the synthesis of new calcium antagonists [2] and new imidazolinic derivatives [3] having this skeleton. Ethyl 3,4-dihydro-2H-1,4-benzoxazine-2-carboxylate was the starting material to enter in this series.

Usually the synthesis of 3,4-dihydro-2H-1,4-benzox-azine-2-carboxylate was performed by treating 2 -aminophenol with ethyl 2,3-dibromopropanoate to afford the benzoxazinic compound 1a [4] and not the isomeric derivative 2a (Scheme 1).
The influence of the substitution on the nitrogen atom of the starting aminophenol ( $\mathrm{R}=\mathrm{CH}_{3}, \mathrm{R}=\mathrm{Ts}$ ) has been investigated [1c,5,6]. In all cases the structures $\mathbf{1 b}, \mathbf{c}$ were obtained; Bartsch [5] has demonstrated that the correct structure for the 2,3-dihydro-1,4-benzoxazine obtained from the $2-\mathrm{N}$-tosylaminophenol is $\mathbf{1 c}$ and not $\mathbf{2 c}$ [6].
For our own part we have reacted 7 -hydroxyindoline 5 [7], which may be considered as 2 -aminosubstituted phenol, with ethyl 2,3-dibromopropanoate to obtain (Scheme 2) compound 6 in $83 \%$ yield which structure has been unambigously determined by 2D NMR assignement.

\end{array}
$$

So the direct condensation of ethyl 2,3-dibromopropanoate with 2 -substituted aminophenols always led to benzoxazines $\mathbf{1}$. Since structures of type 2 correspond to strained aminoacid, it would be of interest to develop new methods to reach these structures.

One approach to prepare 2 was to start from 1,4-benzoxazine derivatives, introducing at the correct position an ester group; an other was to generate the ester function by modification of a 3-functional group already present on the 2,3-dihydro-1,4-benzoxazine moiety. The first approach was illustrated with the benzoxazinic derivative 7. Coudert et al. [8] have reacted ethyl chloroformate with the lithio derivative of benzoxazine 7 to afford the ethyl 1,4-benzox-azine-3-carboxylate $\mathbf{8}$ which was a very good precursor for compounds 2 (Scheme 3). Thus the catalytic hydrogenation of $\mathbf{8}$ in ethanol over palladium on carbon ( $\mathrm{Pd} / \mathrm{C}$ ) gave the desired ethyl 3,4-dihydro-2H-1,4-benzoxazine-3-carboxylate $2 \mathbf{d}$ in $49 \%$ yield; this reduction was reluctant in our conditions: $50 \mathrm{~atm}, 25 \%$ weight of palladium, 3 days at room temperature. The nmr data of $\mathbf{2 d}$ were consistent with the structure and different from compound 1d [9].

The second approach to compounds 2 was the oxidation of products having an hydroxymethyl group at the 3-position such as in compound 9 [10]. The use of DessMartin periodinate reagent, Magtrieve ${ }^{\mathrm{TM}}$ reagent, potassium permanganate and Swern oxidation led only to degradation products (Scheme 4).

Although oxidation of $\mathbf{9}$ was fruitless, more success has been achieved by Bartsch in the hydrolysis of the nitrile group of compound $\mathbf{1 0}$ [5] which afforded (Figure 1) the required ester 2c (68\% yield).

Nevertheless, within our hand, the deprotection of the nitrogen atom of 2c afforded degradation products; so we decided to carefully investigate the condensation of various

Scheme 2

Scheme 3

substituted 2-aminophenols 11 with ethyl 2,3-dibromopropanoate using potassium carbonate as base in acetone at reflux (Scheme 5). From 11a we can isolate after tedious chromatographic separation, in low yield (4\%), the "inverse" benzoxazine 2a from the normal benzoxazine 1a which is produced in high yield. With substituted aminophenols 11e-g the yields of benzoxazines $\mathbf{2}$ slightly increased, but were still low (see Table 1). Compounds 2 were relatively unstable and thus they were treated with iodomethane in the presence of potassium carbonate to afford in moderate yield the N -methyl derivatives $\mathbf{1 2}$.
The assignements for structures 2 were based on ${ }^{1} \mathrm{H} \mathrm{nmr}$ and ${ }^{13} \mathrm{C} \mathrm{nmr}$ data which are reported in the Table 2 and Table 3. As an illustrative example the chemical shifts for carbon C-2 and for C-3 in compound $\mathbf{2 e}$ were 65.6 ppm and 53.1 ppm respectively; while for compound $\mathbf{1 e}$ the chemical shifts for the same carbons were respectively 72.4 ppm and 42.3 ppm . The ${ }^{1} \mathrm{H}$ NMR spectra indicated inter alia a chemical shift for the angular proton of $\mathbf{2 e}$ equal to 4.10 ppm compared to 4.67 ppm for $\mathbf{1 e}$.

Scheme 4

More experiments were carried out in order to increase the yield of compounds 2 : use of a mixture of 2-propanol/acetone 1:99 or $50: 50 \mathrm{v} / \mathrm{v}$, addition of water, replacement of potassium carbonate with potassium hydrogenocarbonate; all these modifications were not conclusive.

It was thus possible to obtain benzoxazine $\mathbf{2}$ in low yield by direct condensation of 2 -aminophenol. Compounds 2 might result either from a Michael addition on ethyl 2-bromoacrylate, generated in situ, or from a direct displacement of a bromine atom by the oxygen atom rather than the nitrogen atom of the 2-aminophenol.

We have envisaged to direct the reaction towards the formation of benzoxazines 2 by masking or decreasing the nucleophilicity of the nitrogen atom of the 2-aminophenol. This approach has been described using trifluoroacetyl or $p$-toluenesulfonyl group as withdrawing groups on the nitrogen atom for the preparation of ethyl 2-(4-tosyl-3,4-dihydro- $2 H$-1,4-benzoxazin-3-yl)acetate $\mathbf{4 c}$ [11]. Since the use of the $p$-toluenesulfonyl group was unfruitfull for obtaining 2c [5] we planned to use an imine as the precursor of the amino group. We first tested this approach in the synthesis of ethyl 2-(4-benzyl-3,4-dihydro-2H-1,4-benzoxazin-3-yl)acetate 4e (Scheme 6).
The aminophenol 11a reacted with benzaldehyde to afford the imine $\mathbf{1 3}$ [12] which was treated with ethyl bromocrotonate to afford imine $\mathbf{1 4}$. The in situ reduction of 14 with sodium borohydride in isopropanol gave the corresponding amine which spontaneously undergoes an intramolecular Michael addition to afford the benzoxazine $4 e$ in a global yield of $65 \%$. During the reduction, a small amount of compound $\mathbf{1 5}$ was formed and isolated in $8 \%$ yield (Figure 2). Application of this imine methodology

Figure 1

15
Figure 2
for the synthesis of compounds 2 resulted in a mixture of products. The usual isomeric benzoxazine 3e [13] was produced in satisfactory yield by an initial reduction of imine $\mathbf{1 3}$ to the 2-benzylaminophenol, followed by condensation with ethyl bromocrotonate.

In conclusion we have described the formation of 3,4-dihydro- 2 H -1,4-benzoxazine-3-carboxylate during the synthesis of 3,4-dihydro-2H-1,4-benzoxazine-2carboxylate. Using a precursor that posseses the ethoxycarbonyl group in position-3 of the benzoxazine framework, the obtention of 2 was easy.

## EXPERIMENTAL

Both ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were obtained with a Bruker instrument Avance DPX250 ( 250 MHz ); for samples in deuteriochloroform solution with tetramethylsilane as internal standard, chemical shifts ( $\delta$ values) were reported in parts per million and coupling constants ( $J$ values) in Hz. The IR spectra were recorded as a thin film on sodium chloride plates for the oils and in a potassium bromide pellet for solids on a Perkin-Elmer spectrometer FT Par agon1000 PC. Mass spectra were recorded on a Perkin-Elmer mass spectrometer SCIEX API 300 (ionspray or heat nebuliser). Melting points were measured using a Kofler hot stage apparatus and are uncorrected. Flash column chromatography was performed on silica gel (Merck 60, 230-400 mesh). Thin layer chromatography was performed on pre-coated silica gel plates (Merck 60, F254, 0.25mm). The solvents were HPLC grade.

General Procedure for the Synthesis of Compounds 2.
To a stirred suspension of 2-aminophenol 11 (18 mmoles) and potassium carbonate ( 50 mmoles ) in acetone ( 100 ml ) was added ethyl 2,3-dibromopropanoate ( 19.8 mmoles). The mixture was refluxed for 18 hours. After filtration the filtrate was concentrated in vacuo to give a residue which was separated twice on silica gel using ethyl acetate/petroleum ether 7:3 as eluent to give first compound $\mathbf{1}$ and then compound 2.

4-(tert-Butyl)-3-ethyl-3,4-dihydro-2H-1,4-benzoxazine-3,4dicarboxylate (2d).

To a solution of compound 8 [8] ( $230 \mathrm{mg}, 0.64 \mathrm{mmole}$ ) in ethanol ( 25 ml ), palladium on charcoal/ $10 \%(70 \mathrm{mg})$ was added. Hydrogen was admitted in the pressure steel vessel ( 50 atm ) and the mixture stirred at room temperature for 3 days.

After filtration and evaporation in vacuo the residue was separated on silica gel using ethyl acetate/petroleum ether 3:7 to give an oil; 113 mg (49\%).

Anal. Calcd. for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NO}_{5}$ : C, 62.53; $\mathrm{H}, 6.89 ; \mathrm{N}, 4.56$. Found: C, 62.25; H, 7.01; N, 4.73.

Ethyl 2-(4-Benzyl-3,4-dihydro-2H-1,4-benzoxazin-3$\mathrm{yl})$ acetate (4e).

A mixture of ethyl 4-bromocrotonate ( $0.52 \mathrm{ml}, 2.83 \mathrm{mmoles}$ ), potassium carbonate ( $719 \mathrm{mg}, 5.21 \mathrm{mmoles}$ ) and imine 13 [12] ( $505 \mathrm{mg}, 2.56 \mathrm{mmoles}$ ) in ethanol ( 6 ml ) was stirred at room temperature for 3 days. After filtration and evaporation the residue was dissolved in ethanol ( 18 ml ); silica gel ( 2.10 g ) was added and the mixture was cooled at $0{ }^{\circ} \mathrm{C}$. Sodium borohydride ( $261 \mathrm{mg}, 6.83 \mathrm{mmoles}$ ) was portionwise added in 15 minutes and the mixture was stirred for 30 hours at room temperature. The mixture was filtrated over filter aid and evaporated in vacuo; water was added and the mixture was extracted with ethyl acetate; the organic layers were dried over magnesium sulfate and evaporated. The residue was separated on silica gel (petroleum ether/ethyl acetate $75: 25$ ) to afford 4 e as white solid ( $518 \mathrm{mg}, 65 \%$ ); mp $57{ }^{\circ} \mathrm{C}$ (ethyl acetate). IR (potassium bromide): $v\left(\mathrm{~cm}^{-1}\right) 1723$ (CO). ${ }^{1} \mathrm{H} \mathrm{nmr}$ (deuteriochloroform): $\delta$ $1.22\left(\mathrm{t}, 3 \mathrm{H}, J=7.1 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; 2.58(\mathrm{dd}, 1 \mathrm{H}, J=5.1 \mathrm{~Hz}, 16.1 \mathrm{~Hz}$, $\mathrm{CH}_{2} \mathrm{CO}$ ); $2.71\left(\mathrm{dd}, 1 \mathrm{H}, J=8.4 \mathrm{~Hz}, 16.1 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CO}\right) ; 3.83-3.89$ $(\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}), 4.03-4.16\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{O}\right) ; 4.09(\mathrm{q}, 2 \mathrm{H}, J=7.1 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2}\right) ; 4.27\left(\mathrm{dd}, 1 \mathrm{H}, J=4.3 \mathrm{~Hz}, 10.9 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{O}\right) ; 4.43(\mathrm{~d}, 1 \mathrm{H}$, $\left.J=16.5 \mathrm{~Hz}, \mathrm{NCH}_{2}\right) ; 4.54\left(\mathrm{~d}, 1 \mathrm{H}, J=16.5 \mathrm{~Hz}, \mathrm{NCH}_{2}\right) ; 6.57-6.67$ (m, 2H, Harom); 6.75-6.87 (m, 2H, Harom); 7.22-7.37 (m, 5H, Harom). ${ }^{13} \mathrm{C}$ nmr (deuteriochloroform): $\delta 14.3\left(\mathrm{CH}_{3}\right) ; 35.1$ $\left(\mathrm{CH}_{2}\right) ; 53.6(\mathrm{CH}) ; 54.4\left(\mathrm{CH}_{2}\right) ; 60.9\left(\mathrm{CH}_{2}\right) ; 66.7\left(\mathrm{CH}_{2}\right) ; 113.5$ $(\mathrm{CH}) ; 116.6(\mathrm{CH}) ; 117.9(\mathrm{CH}) ; 122.2(\mathrm{CH}) ; 127.0(2 \mathrm{CH}) ; 127.4$ (CH); $128.9(2 \mathrm{CH}) ; 133.9(\mathrm{C}) ; 138.3(\mathrm{C}) ; 143.5(\mathrm{C}) ; 171.8(\mathrm{CO})$; ms : (ionspray) m/z $312(\mathrm{M}+1)^{+}$.

Anal. Calcd. for $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{NO}_{3}$ : C, 73.29; H, 6.80; N, 4.50. Found: C, 72.92; H, 6.94; N, 4.67.
Ethyl 2,3,5,6-Tetrahydro[1,4]oxazino[2,3,4-hi]indole-2carboxylate (6).

Using the general procedure as for 2, starting from 7-hydroxyindoline 5 [7], compound $\mathbf{6}$ was obtained in $83 \%$ yield. IR (film): $v\left(\mathrm{~cm}^{-1}\right) 1753(\mathrm{CO}) ;{ }^{1} \mathrm{H} \mathrm{nmr}\left(\right.$ pyridin- $\left.d_{5}, 400 \mathrm{MHz}\right): \delta 1.15(\mathrm{t}, 3 \mathrm{H}$, $\left.J=7.0 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; 2.70-2.78\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}_{6}\right) ; 2.89(\mathrm{q}, 1 \mathrm{H}, J=8.9 \mathrm{~Hz}$, $\mathrm{H}_{5}$ ); $3.03\left(\mathrm{dd}, 1 \mathrm{H}, J=2.8 \mathrm{~Hz}, 12.0 \mathrm{~Hz}, \mathrm{H}_{3 \mathrm{a}}\right) ; 3.22-3.28\left(\mathrm{~m}, \mathrm{H}, \mathrm{H}_{5}\right)$; 3.49 (dd, $\left.1 \mathrm{H}, J=4.3 \mathrm{~Hz}, 12.0 \mathrm{~Hz}, \mathrm{H}_{3 \mathrm{~b}}\right) ; 4.09-4.17(\mathrm{~m}, 2 \mathrm{H}, J=7.0 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2}\right) ; 5.23\left(\mathrm{dd}, 1 \mathrm{H}, J=2.8 \mathrm{~Hz}, 4.3 \mathrm{~Hz}, \mathrm{H}_{2}\right) ; 6.67-6.75(\mathrm{~m}, 2 \mathrm{H}$, Harom); 6.90-6.95 (m, 1H, Harom). ${ }^{13} \mathrm{C} \mathrm{nmr} \mathrm{(deuteriochloroform):}$ $\delta 15.0\left(\mathrm{CH}_{3}\right) ; 30.2\left(\mathrm{CH}_{2}\right) ; 49.5\left(\mathrm{CH}_{2}\right) ; 56.9\left(\mathrm{CH}_{2}\right) ; 62.5\left(\mathrm{CH}_{2}\right) ; 75.2$ (CH); 113.7 (CH); $118.0(\mathrm{CH}) ; 121.6(\mathrm{CH}) ; 131.1(\mathrm{C}) ; 138.6(\mathrm{C})$; 142.7 (C); 170.2 (CO); ms: (ionspray) m/z 234 (M+1)+.

Anal. Calc. For $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{NO}_{3}: \mathrm{C}, 66.94 ; \mathrm{H}, 6.48 ; \mathrm{N}, 6.00$. Found C, 67.33; H, 6.29; N, 5.81.

General Procedure for Methylation of Compounds 2: Compounds 12.
A stirred suspension of compound 2 ( 10 mmoles ), potassium carbonate ( 30 mmoles ), iodomethane ( 30 mmoles ) in acetone $(75 \mathrm{ml})$ was refluxed for 18 hours. After filtration, the filtrate was concentrated in vacuo to give a residue which was twice separated on silica gel using ethyl acetate/petroleum ether 7:3 as eluent to give compound 12.

Ethyl 4-[2-(Benzylamino)phenoxy]butanoate (15).
This compound was obtained from the reduction of $\mathbf{1 4}$ in $8 \%$ yield as an oil. IR (film): $v\left(\mathrm{~cm}^{-1}\right) 3425(\mathrm{NH}), 1733(\mathrm{CO}) .{ }^{1} \mathrm{H} \mathrm{nmr}$ (deuteriochloroform): $\delta 1.23\left(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; 2.09-2.19$ $\left(\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ; 2.49\left(\mathrm{t}, 2 \mathrm{H}, J=6.5 \mathrm{~Hz}, \mathrm{CH}_{2}\right) ; 4.05(\mathrm{t}, 2 \mathrm{H}, J=$ $\left.6.5 \mathrm{~Hz}, \mathrm{OCH}_{2}\right) ; 4.10\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}, \mathrm{OCH}_{2}\right) ; 4.37\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$; 4.68 (br s, 1H, NH); 6.55-6.67 (m, 2H, Harom); 6.75-6.84 (m, 2H, Harom); 7.23-7.40 (m, 5H, Harom). ${ }^{13} \mathrm{C} \mathrm{nmr}$ (deuteriochloroform): $\delta 14.4\left(\mathrm{CH}_{3}\right) ; 24.9\left(\mathrm{CH}_{2}\right) ; 31.3\left(\mathrm{CH}_{2}\right) ; 48.1\left(\mathrm{CH}_{2}\right)$; $60.7\left(\mathrm{CH}_{2}\right) ; 67.4\left(\mathrm{CH}_{2}\right) ; 110.4(\mathrm{CH}) ; 110.6(\mathrm{CH}) ; 116.7(\mathrm{CH})$; $121.6(\mathrm{CH}) ; 127.2(2 \mathrm{CH}) ; 127.5(\mathrm{CH}) ; 128.8(2 \mathrm{CH}) ; 138.4(\mathrm{C})$; 139.9 (C); 146.0 (C); 173.4 (CO); ms: (ionspray) m/z 314 (M+1)+.

Anal. Calcd. for $\mathrm{C}_{19} \mathrm{H}_{23} \mathrm{NO}_{3}$ : C, 72.82; H, 7.40; N, 4.47. Found: C, 72.96; H, 7.29; N, 4.60.
