#### Abstract

Adrenoceptors beta-3-subtype mediate lipolysis and in the search for potential beta-3-adrenergic receptors agonists for the treatment of obesity, we designed new arylethanolamines (structures $\mathbf{4}, \mathbf{5}$ ) and aryloxypropanolamines (structures $\mathbf{6}, 7$ ) derived from $2(3 \mathrm{H})$-benzoxazolone and $2(3 \mathrm{H})$-benzothiazolone.

J. Heterocyclic Chem., 38, 633 (2001).

Beta-3-adrenoreceptor agonists are potential therapeutic agents for the treatment of metabolic disorders such as obesity and diabetes [1-3].

A large number of beta-3-adrenergic receptor agonists belong to two general structural classes (Figure 1): i.e., arylethanolamine, e.g., $\mathbf{1}$ [4] and aryloxypropanolamine, e.g., $2[5,6]$. Hence, efforts are underway in our laboratory to synthesize novel, potent and selective beta-3-adrenergic receptor agonists. In a recent work [7] we describe the preparation of compound 3 (Figure 2) which includes two 2(3H)-benzoxazolone heterocycles:

Arylethanolamine (1)

Aryloxypropanolamine (2)

Figure 1
the first one filling the place of the phenyl ring of the phenylethanolamine moiety, the second one bearing the acidic functionality of the arylalkyl group.

In the present study, our aim was to further investigate the role of the $2(3 H)$-benzoxazolone unit bearing the acidic functionality. So we replaced this moiety by a phenoxyacetic group and prepared the two benzoxazolinonic and benzothiazolinonic series of arylethanolamines (4-5) and aryloxypropanolamines (6-7) (Figure 2).
Compounds listed in figure 2 were synthesized according to Schemes 1-4. Synthesis of amines $\mathbf{1 0}$ and $\mathbf{1 1}$ (Scheme 1) started with the commercially available 2-(4-hydroxyphenyl)ethylamine hydrochloride which was $N$-Boc protected [8] and allowed to react with ethylbromoacetate in
the presence of potassium carbonate to yield 9 (94\%). Cleavage of the tert-butyloxycarbonyl protecting group occurred in acidic medium leading to $\mathbf{1 0}$ with $90 \%$ yield. Condensation with benzaldehyde followed by reduction with sodium borohydride gave the secondary amine 11 (55\%).

The preparation of racemic arylethanolamines 4 and 5 was described in Scheme 2. Starting from 6-(2-bromo-acetyl)-3-methyl-2(3H)-benzoxazolone (12) $[9,10]$ and its sulphured analogue $\mathbf{1 3}$ [11], a substitution reaction with the secondary amine $\mathbf{1 1}$ provide compounds $\mathbf{1 4}$ and $\mathbf{1 5}$ with $67 \%$ and $60 \%$ yield. Cleavage of the benzyl group by 1-chloroethyl chloroformate and methanol [12] afforded 16 and 17 with $70 \%$ and $75 \%$ yield, respectively. Then, reduction of the ketone with sodium borohydride in

[2(3H)-Benzoxazolon-3-yl] acetic acid moiety (3)

Scheme 3

methanol followed by hydrolysis of the ester functions with $6 M$ hydrochloric acid respectively provided the corresponding acid derivatives 4 and 5 .
On the other hand, the epoxide 24 was prepared in a three step procedure starting from 6-methoxy-2(3H)benzoxazolone (Scheme 3) which was successively treated with dimethylsulfate in basic medium to afford compound 20 in $87 \%$ yield and with boronetribromide in methylene chloride to yield 22 ( $76 \%$ ). Condensation of epibromhydrin with the phenolic compound 22 in the presence of potassium carbonate provides 24 with $85 \%$ yield. Starting from 6-methoxy-2(3H)-benzothiazolone [13] a similar pathway was used for the sulphured analogue 25 with comparable yields (Scheme 3).

The nucleophilic substitution of 24 and 25 by the primary amine 10 lead to the racemic esters 26 and 27 which after hydrolysis provided the acid derivatives 6 and 7 with an overall yield of $32 \%$ and $38 \%$, respectively (Scheme 4).

## EXPERIMENTAL

Melting points were determined using a Büchi 530 melting point apparatus and are uncorrected. The ir spectra were recorded on a Perkin-Elmer 297 spectrometer and the ${ }^{1} \mathrm{H}$ nmr spectra were recorded using a Brücker AC 300 spectrometer. Chemical shifts are reported in ppm with tetramethylsilane as internal standard. All compounds were found homogenous in TLC (Merck silicagel 60F254, ethyl acetate/acetone, 60/40, $\mathrm{v} / \mathrm{v}$ ). Elemental analyses were performed by the "Service Central de Microanalyses", CNRS, Vernaison, France and are within $\pm 0.4 \%$ of the calculated values. Compounds $\mathbf{1 2}$ and $\mathbf{1 3}$ were synthesized according to the previously described procedures [9-11].

## [2-(4-Hydroxyphenyl)ethyl]carbamic Acid tert-Butyl Ester (8).

Triethylamine ( $19 \mathrm{ml}, 100 \mathrm{mmol}$ ) was added to a solution of 2-(4-hydroxyphenyl)ethylamine hydrochloride ( 17.4 g , 100 mmol ) in 200 ml of a mixture of dioxane-water (3/1). Di-tert-butyldicarbonate ( $21.8 \mathrm{~g}, 100 \mathrm{mmol}$ ) was then added.

Compound 26 ( $0.48 \mathrm{~g}, 1 \mathrm{mmol}$ ) was dissolved in 6 M hydrochloric acid ( 80 ml ). The solution was heated under reflux for 5 minutes, and then cooled to $4^{\circ} \mathrm{C}$ to obtain a precipitate that was isolated by filtration and recrystallized from ethanol-water (7/3) to give 6 in $76 \%$ yield: mp 230-233 ${ }^{\circ} \mathrm{C}$; ir (potassium bromide): v $3460(\mathrm{OH}), 1750(2(3 \mathrm{H})$-benzoxazolone CO$), 1715$ (carboxylic CO ) $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H} \mathrm{nmr}$ (dimethyl- $\mathrm{d}_{6}$ sulfoxide): $\delta$ 2.90-3.20 (m, 6H, CH2 $\mathrm{CH}_{2} \mathrm{NHCH}_{2}$ ), 3.35 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{NCH}_{3}$ ), 4.00 (d, $\left.2 \mathrm{H}, \mathrm{CHCH}_{2} \mathrm{O}, \mathrm{J}=5.10 \mathrm{~Hz}\right), 4.20(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CHOH}), 4.65$ (s, $2 \mathrm{H}, \mathrm{COCH}_{2}$ ), $6.00\left(\mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{OH}\right.$ exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right)$, 6.63-7.19 (m, $7 \mathrm{H}, \mathrm{H}_{\text {aromatics }}$ ), 8.76 (br s, $1 \mathrm{H}, \mathrm{NH}$ of $\mathrm{NH}_{2}{ }^{+}$ exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ), 8.90 (br s, $1 \mathrm{H}, \mathrm{NH}$ of $\mathrm{NH}_{2}{ }^{+}$ exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ), 13.00 (br s, $1 \mathrm{H}, \mathrm{COOH}$ exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ).
