
#### Abstract

$N$-Hydroxyalkyl-l-menthopyrazoles acted as a chiral catalyst for the diethylzinc (1) addition to aromatic aldehydes, and 1-aryl-1-propanols were afforded enantioselectively. These reactions were carried out optimally in toluene at $40^{\circ} \mathrm{C}$ in the presence of $30 \mathrm{~mol} \%$ of (2'S)-2-(2-phenyl-2-hydroxyethyl)-3-phenyl-1-menthopyrazole $((S)-\mathbf{1 6 d})$ to afford optically active 1-aryl-1-propanols up to $70 \%$ ee $(S)$.

J. Heterocyclic Chem., 39, 917(2002).

Recently we have developed the preparation and the utilities of 3-phenyl-l-menthopyrazole as a new chiral auxiliary [1], which has a unique structure and properties relative to the conventional chiral auxiliaries [2]. The most important characteristics of this auxiliary are that the substrate terminates at a nitrogen atom of the heteroaromatic pyrazole ring, and that the substrate is surrounded by the chiral environment. These structural features cause the diastereofacial attack on the substrate moiety in the reactions with alkyl halides [3], diphenyldisulfide [4], acyl chloride [5], aldehydes [6], and $\mathrm{C}=\mathrm{N}$ compounds [7]. Moreover, the asymmetric additions of Grignard reagents [8], dienes [9] and 1,3-dipolar compounds [10] on 2-( $\alpha, \beta$ -unsaturated)acyl-3-phenyl- $l$-menthopyrazoles have been reported. Otherwise, $N$-acylheteroaromatics such as N -acylimidazoles are utilized as the activated acyl moiety in a wide varieties of organic syntheses [11]. As an analogue of these $N$-acylheteroaromatics, $N$-acylpyrazoles are easily converted into acyl derivatives by the action of nucleophiles such as alcohols [12], amines [13], Grignard reagents [14], or organozinc compounds [15] under basic or acidic conditions.
Many reports of chiral amino alcohols relating to enantioselective synthesis have appeared in the literature. The chiral amino alcohols behave as a ligand for a metal atom to form a complex, which takes the role of an optically active Lewis acid. Since $l$-menthopyrazole derivatives exhibit both the characteristic of Lewis basicity and asymmetric structure, the introduction of a hydroxyl group was expected to exploit the utilities of $l$-menthopyrazoles as a ligand for an optically active Lewis acid. On this strategy, the utility of $l$-menthopyrazole derivatives having an hydroxyalkyl group was investigated as an optically active catalyst for the borane reduction of ketones [16]. As a part of these investigations been hoped to extend the catalytic use of pyrazole derivatives in synthetic reactions especially in asymmetric reactions.

Recently, Soai and his co-workers focused their attention on the addition reaction of dialkylzinc toward aldehydes in the presence of chiral amino alcohols, and elucidated their enantioselective reaction mechanism, catalyzed by an optically active Lewis acid [17]. Since then, some
papers using various amino alcohols followed to give similar enantioselective addition of dialkylzinc toward aldehydes [18]. With the background, we wish to report the reaction of diethylzinc with aldehydes catalyzed by $l$-menthopyrazoles having the hydroxylalkyl group.

## Results and Discussion

$N$-(1-Hydroxyalkyl)pyrazoles were previously reported to be prepared by the action of aldehydes toward $N$-unsubstituted pyrazoles [16a]. From these facts, the Lewis acid complex of $N$-(1-hydroxyalkyl)pyrazoles with dialkylzinc should be formed in situ by aldehydes with pyrazoles. Moreover, this complex was expected to act as a self-catalyst in the addition reaction of dialkylzinc to aldehydes. Actually 1-(4-methylphenyl)-1-propanol (3a) was obtained by the action of diethylzinc (1) toward 4-methylbenzaldehyde (2a) in the presence of 3,5-dimethylpyrazole (4). This catalytic effect was observed with less than 30 $\mathrm{mol} \%$ of 4. These results indicated the catalytic effect of N -unsubstituted pyrazole for the addition reaction of dialkylzinc to aldehydes through the formation of Lewis acid complex.

5

Next, the catalytic effect of 3-phenyl-l-menthopyrzole (5a), which was recently designed as an optically active pyrazole, was studied in the addition reaction of dialkylzinc to aldehydes. In the meanwhile, isomenthopyrazole [ $(4 R, 7 R)$-4-methyl-7-isopropyl-4,5,6,7-tetrahydro-indazole], (5b) was designed at an optically active pyrazole [19]. Therefore the catalytic effects of $\mathbf{5 b}$ were also examined. In the various solvents, a mixture of 1.3 mmol of $\mathbf{2 a}$
 hydroxymethylpyrazoles. Since $N$-acyl-3-phenyl-l-menthopyrazoles ( $\mathbf{8}$ and 9 ) could be prepared regioselectively, the regioselective formation of zinc complex of N -(1hydroxyalkyl)pyrazoles ( 6 or 7) was expected in situ by the reaction of N -acylpyrazoles with dialkylzinc. The catalytic effect of $\mathbf{8}$ and $\mathbf{9}$ in the addition reaction of $\mathbf{1}$ to $\mathbf{2 a}$ is summarized in Table 1. As another attempt toward the

regioselective formation of catalysts such as $\mathbf{1 0}$ and 11, another Lewis base center consisting of hydroxyl or methoxy groups was introduced on pyrazole derivatives $(\mathbf{5 d}, \mathbf{5 e}$, and $\mathbf{5 g})$. However, the data in Table 1 illustrate that these attempts gave unsatisfactory results, and such

Scheme 3

Lewis basic centers do not affect the promotion of enantioselectivity in the addition reaction of dialkylzinc to aldehydes. From these facts, the formation of a chiral catalyst of $N$-( $\alpha$-hydroxylalkyl)- $l$-menthopyrazoles was prepared in situ with ease, but the satisfactory results in enantioselectivity of dialkylzinc addition could not be obtained by less diastereoselective formation of these catalyst.

On the other hand, $N$-(2-hydroxyethyl)pyrazoles were prepared by the direct alkylation of the corresponding pyrazoles.

Also $N$-(2-hydroxyethyl)pyrazoles were prepared by the hydride reduction of pyrazolylacetates (13g, 13h, 14g and $\mathbf{1 4 h}$ ) or aroylmethylpyrazoles (13d-f and 14d-f), and were easily isolated regio- and diastereoselectively as stable substances [16]. The catalytic effect of $N$-(2-hydroxyethyl)pyrazoles was optimized by the reaction of $\mathbf{2 a}$ with $\mathbf{1}$ in the presence of 1-(2-hydroxyethyl)-3,5-dimethylpyrazole (12) under various reaction conditions. The data in Table 2 exhibit that $30 \mathrm{~mol} \%$ of $\mathbf{1 2}$ catalyzed sufficiently the addition reaction of dialkylzinc to aldehydes at $40^{\circ} \mathrm{C}$ in toluene.

When various 1-(2-hydroxyethyl)- (15) and 2-(2-hydrox-yethyl)- $l$-menthopyrazole derivatives (16) were used as the chiral catalyst, $\mathbf{1}$ reacted with $\mathbf{2 a}$ in an enantioselective manner and the results are summarized in Table 3. The stereo structures of menthopyrazole moiety in $\mathbf{1 5}$ and $\mathbf{1 6}$ were affected to the formation of $(R)$-3a and ( $S$ )-3a respectively, but their effects were rather small. The enantioselective control of the product was governed mainly by the

substituent group adjacent to the hydroxyl group, where the substituent group with ( $S$ )-configuration on the $\beta$-carbon preferably gave $(S)-\mathbf{3 a}$. In the case of ( 2 'S)-2-(2-phenyl-2-hydroxyethyl)-3-phenyl-l-menthopyrazole ((S)-16d), the structures of menthopyrazole moiety and side chain were complementarily affected to the formation of $(S)$ - $\mathbf{3 a}$. Furthermore, the addition reaction of $\mathbf{1}$ with some aromatic aldehydes (2) afforded the corresponding alcohols (3) enantioselectively, as summarized in Table 4.
$N$-Hydroxyalkyl- $l$-menthopyrazoles acted as a chiral catalyst for the diethylzinc (1) addition to 4-methylbenzaldehyde (2a), and 1-(4-methylphenyl)-1-proparnol (3a) was afforded enantioselectively. These reactions were carried out optimally in toluene at $40^{\circ} \mathrm{C}$ in the presence of 30 $\mathrm{mol} \%$ of ( $S$ )-16d to afford optically active 1-aryl-1propanols up to $70 \%$ ee $(S)$.

## EXPERIMENTAL

Melting points are uncorrected. ${ }^{1} \mathrm{H} \mathrm{nmr}$ and ${ }^{13} \mathrm{C} \mathrm{nmr}$ spectra were obtained on JEOL JNM-EX270 ( 270 MHz ) or Varian GEMINI $2000(200 \mathrm{MHz})$ spectrometers in deuterochloroform with tetramethylsilane as an internal standard. The IR spectra were measured by Shimadzu IR-460 spectrophotometer. Specific rotations were measured on JASCO DIP-370 digital polarimeter. The enantiomer ratios were evaluated from the peak ratios of gas chromatography on SHIMADZU GC-14A gas chromatograph using Chrompack Chirasil DEX-CB capillary column ( $0.25 \mathrm{~mm} \times 25 \mathrm{~m}$ ). The yields of the products were evaluated by GL Science GC-353 gas chromatograph using dimethylsiloxane type capillary column ( $0.25 \mathrm{~mm} \times 30 \mathrm{~m}$ ) of GL Science TC-1.

## Materials.

Ether and THF were dried over ketyl radical generated from sodium and benzophenone. Toluene was dried over calcium hydride with refluxing. Diethylzinc hexane solution ( $1 \mathrm{~mol} / \mathrm{L}$ ) was commercially available from Kanto Chemical CO. Compounds $\mathbf{5 c}, \mathbf{5 d}, \mathbf{5 f}, \mathbf{1 2}, \mathbf{1 3 h}$ and $\mathbf{1 4 h}$ were prepared according to previously described method [16]. Isomenthopyrazole (5b) was prepared by the method of Bovens [19]. $N$-Acyl-3-phenyl- l menthopyrazoles ( $\mathbf{8}$ and $\mathbf{9}$ ) were directly acylated with the corresponding acyl chloride from $\mathbf{5 a}$ [3].

Preparation of N -(2-Hydroxyethyl)-menthopyrazoles.
Menthopyrazole- N -acetates ( 1.5 mmol ) was reduced by treatment with lithium aluminum hydride ( $65 \mathrm{mg}, 1.7 \mathrm{mmol}$ ) in anhydrous ether ( 5 ml ) for 1.5 hour at room temperature. Similarly, N -aroylmethyl menthopyrazoles $(0.5 \mathrm{mmol})$ were reduced with lithium aluminum hydride ( $60 \mathrm{mg}, 1.6 \mathrm{mmol}$ ) in anhydrous ether $(4 \mathrm{ml})$ for 1.5 hour at room temperature. After the mixture was quenched with water, the mixture was filtered. The organic layer was washed with saturated sodium chloride, dried over anhydrous magnesium sulfate, and concentrated. The residue was purified by silica gel column chromatography with hexane-ethyl acetate mixture. N -(2-hydroxyethyl)-menthopyrazoles were also prepared by the alkylation of menthopyrazole ( $\mathbf{5 a}$ and $\mathbf{5 b}$ ) under high pressure conditions according to a previously described method [16].

## 1-(2-Hydroxyethyl)-3-phenyl-l-menthopyrazole (15a).

This compound was obtained as a colorless oil in $92 \%$ yield; ${ }^{1} \mathrm{H}$ nmr: $\delta 0.92(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}), 0.99(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}), 1.01$ ( $3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}$ ), 1.42-1.49 (1H, m), 1.747-1.83 ( $2 \mathrm{H}, \mathrm{m}$ ), 2.05 $(2 \mathrm{H}, \mathrm{m}), 2.59(1 \mathrm{H}, \mathrm{q}, J=5.0 \mathrm{~Hz}), 4.04(2 \mathrm{H}, \mathrm{s}), 4.09-4.22(2 \mathrm{H}$, m), $4.63(1 \mathrm{H}, \mathrm{m}), 7.26-7.43(3 \mathrm{H}, \mathrm{m}), 7.73(2 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz})$; ${ }^{13} \mathrm{C}$ nmr: $\delta 19.7\left(\mathrm{CH}_{3}\right), 20.3\left(\mathrm{CH}_{3}\right), 21.4\left(\mathrm{CH}_{3}\right), 21.4\left(\mathrm{CH}_{2}\right)$, $25.9\left(\mathrm{CH}_{2}\right), 27.7(\mathrm{CH}), 31.5(\mathrm{CH}), 37.2(\mathrm{CH}), 50.6\left(\mathrm{CH}_{2}\right), 62.1$ $\left(\mathrm{CH}_{2}\right), 118.8(\mathrm{C}), 127.0(\mathrm{CH}), 127.3(\mathrm{CH}), 128.4(\mathrm{CH}), 134.5$ (C), 142.7 (C).

Diethylzinc Addition Reaction on Aromatic Aldehyde.
With $N$-Unsubstituted Pyrazoles.
To the mixture of $N$-unsubstituted pyrazole $(0.3 \mathrm{mmol})$, aromatic aldehyde $(1.3 \mathrm{mmol})$ in toluene $(4 \mathrm{ml})$ was added diethyl zinc hexane solution ( $1 \mathrm{~mol} / 1,2.0 \mathrm{ml}$ ) under argon atmosphere. The mixture was stirred for several hours at $40^{\circ} \mathrm{C}$. The small portion of reaction mixture was quenched with hydrochloric acid in some intervals, and was monitored by gas chromatography using naphthalene as the internal standard. The reaction mixture was quenched with dilute hydrochloric acid and the organic layer was washed with water, dilute sodium hydroxide and saturated sodium chloride. After drying over anhydrous magnesium sulfate, the solvent was evaporated, and the desired 1-aryl-1propanol was distilled using a cold finger apparatus. The ee of distillate was evaluated by gas chromatography through a chiral phase column. From the residue of the distillation, pyrazole compounds were isolated by silica gel column chromatography.

## With $N$-Acylpyrazoles.

To a mixture of $N$-acylpyrazole $(0.3 \mathrm{mmol})$, aromatic aldehyde ( 1.3 mmol ) in toluene $(4 \mathrm{ml})$ was added diethylzinc hexane solution ( $1 \mathrm{~mol} / 1,2.0 \mathrm{ml}$ ) under argon atmosphere. The mixture was stirred for several hours at $40^{\circ} \mathrm{C}$. The reaction mixture was worked up described above.

With $N$-(2-Hydroxyethyl)-pyrazoles.
To the mixture of $N$-(2-hydroxyethyl)-pyrazole ( 0.3 mmol ), aromatic aldehyde $(1.0 \mathrm{mmol})$ in toluene $(4 \mathrm{ml})$ was added diethylzinc hexane solution ( $1 \mathrm{~mol} / 1,2.0 \mathrm{ml}$ ) under argon atmosphere. The mixture was stirred for several hours at $40^{\circ} \mathrm{C}$. The reaction mixture was worked up described above.

Acknowledgement.
The authors are grateful to the Chemical Analysis Center, University of Tsukuba, for the measurement of various kinds of spectra and the elemental analyses.
