#### Abstract

Side chains of docetaxel and its isomer were obtained through Staudinger cycloaddition and catalytic hydrogenation of chlorophenyl intermediates, using chlorobenzaldehyde as starting material. Syntheses of three novel chiral azetidinone derivatives through the Staudinger cycloaddition reaction of chlorophenyl chiral amine Schiff base with different substituted positions were described and their ring-opening reaction under the catalysis of $\mathrm{Pd} / \mathrm{MgCO}_{3}$ or $\mathrm{Pd} / \mathrm{C}$ to afford side chains of docetaxel and its isomer in high yields was investigated. Finally, docetaxel and its isomer were obtained. Single crystal of ( $3 S, 4 R$ )-3-hydroxy- $N-[(S)-$ (1-phenyl)ethyl]-4 -(2'-chlorophenyl) -2-azetidinone (4c) was obtained, the configuration of which was determined by X-ray diffraction. Because of the mild cyclization reaction condition and convenient asymmetric resolution operation when $p$-chlorobenzaldehyde was employed instead of benzaldehyde, the yield of cyclization and hydrogenation increased dramatically and the total yield of docetaxel was higher than the result in literature. When o-chlorobenzaldehyde was employed instead of benzaldehyde an isomer of docetaxel was obtained by the same way.

J. Heterocyclic Chem., 42, 679 (2005).

Docetaxel has been thought as one of as an anticancer pharmaceutical with the most remarkable curative effects, and passed clinical trials of mammary gland cancer, lung cancer, stomach cancer and crown cancer at the end of 1990's. In 1996, it was authorized by Food and Drug Administration (FDA) and applied in clinic [1,2]. Due to its complex structure, great difficulty exists in the total synthesis of docetaxel. Since 10-deacetylbaccatin $\square$ (10$\mathrm{DAB} \square$ ), with a ring structure similar to docetaxel, was extracted in large scale from European Taxus baccata, effective semisynthesis were started to reduce synthetic difficulty and cost of docetaxel dramatically [3-5]. Considering that the key procedure, synthesis of the side chain that joined with $10-\mathrm{DAB} \square$ and ( $3 R, 4 S$ )-3-hydroxy4 -( $p$-chlorophenyl)-2-( $\alpha$-phenylethyl)azetidinone can proceed in high yield, it would become an effective and cheap way to synthesize docetaxel if the chlorine atom can be reduced to a hydrogen atom. Hence, the following reaction route was designed for the synthesis of docetaxel and its isomer (Scheme).

Results and Discussion.
Configurations of $\beta$-Lactams and Side Chain Compounds.
Chiral Schiff bases were employed to afford two diastereoisomers containing the $\beta$-amide ring via the Staudinger cycloaddition reaction. The structure of $\mathbf{4 c}$ has been proven by X-ray diffraction (Figure), and the configuration found to be $3 S, 4 R$. The ( $3 S, 4 R$ )- $\beta$-propiolactam (4c), which was obtained via the Staudinger cycloaddition reaction using the Schiff base of the chiral amine and aromatic aldehyde was deposited in the Cambridge date base (CCDC 252696). Compounds 4a and 4b were determined to be $3 R, 4 S$ configuration on the basis of ${ }^{1} \mathrm{H}-\mathrm{NMR}, \mathrm{H}-\mathrm{HCOSY}$, optical activity and comparison with the structure of $\mathbf{4 c}$. In the ring-opening and hydrogenation reactions, the products retain their original configuration hence the side chain compounds have the same configurations as that of the corresponding $\beta$-lactams.

Figure. X-ray crystal structure of $(3 S, 4 R)$-3-hydroxy-4-(2'-chlorophenyl)-2-( $\alpha$-phenylethyl)azetidinone.

Hydrogenation.
The Pd content in the catalyst plays a key role in the reduction of the chlorine atom. When $\mathrm{Pd} / \mathrm{MgCO}_{3}$ or $\mathrm{Pd} / \mathrm{C}$ containing $3 \% \mathrm{Pd}$ was employed, only $N$-phenylethyl was reduced to ethylbenzene after reacting for 8 h at $50^{\circ} \mathrm{C}$. As the reaction time is increased, the formation of by-products also greatly increased with only partial reduction of chlorine atoms. Both phenylethyl groups and chlorine atoms can be reduced if the content of Pd increased to $10 \%$ under the same reaction conditions. The reaction is complete in 3 h and $\mathrm{Pd} / \mathrm{MgCO}_{3}$ or $\mathrm{Pd} / \mathrm{C}$ containing $8-20 \% \mathrm{Pd}$ was employed for catalytic hydrogenation. The optimum temperature of catalytic hydrogenation is $35-45^{\circ} \mathrm{C}$ with alcohol as solvent. When methanol and ethanol are used, good catalytic effects are observed.

Synthesis.
The acetoxyacetyl chloride, used in the preparation of $\beta$ lactams adopting benzaldehyde as starting materials, is very sensitive to water. Considering that dropwise addition of the acyl chloride/chloroform solution is a long procedure, trace amounts of water in chloroform can react with the acyl chloride to afford the corresponding carboxylic acid, which was precipitates out and does not react further. This results in dramatically lower yields therefore the chloroform must be adequately dried with anhydrous $\mathrm{CaCl}_{2}$ before use.
In this reaction, as far as the mechanism was concerned, the acyl chloride reacts first with triethylamine to form the ketene like intermediate via loss of HCl followed by Stautinger cycloaddition with the Schiff base to form the $\beta$ lactam. According to the literature method [7], we found that the optimum temperature for dropwise addition of the acyl chloride is $-20^{\circ} \mathrm{C}$ followed by raising the temperature above $0{ }^{\circ} \mathrm{C}$, for a reaction time of $4-6$ hours. However, when $p$-chlorobenzaldehyde is used instead benzaldehyde
a cyclization temperature of $-5-10{ }^{\circ} \mathrm{C}$ was appropriate and the reaction time was shortened, evidently to simplify the operation.

Due to the viscosity of the intermediate propiolactam 3a, its isomers cannot be resolved by recrystallization. We used the way that the hydroxy group is released through hydrolysis to resolve the propiolactam, then recrystallized in mixture of ethyl acetate and $n$-hexane (7:1) to afford $\mathbf{4 a}$ (3R,4S)-3-hydroxy-4-( $p$-chlorophenyl)-2-( $\alpha$-phenylethyl)azetidinone in high yield (the total yield of the preceding three steps was about $76 \%$ ). Compared with the corresponding product using benzaldehyde as starting material, this method not only gave higher yields than the literature method [4], but also with a convenient and quick recrystallization operation. The total yield of $\mathbf{4 c}(3 S, 4 R)$-3-hydroxy-4-(2'-chlorophenyl)-2-( $\alpha$-phenylethyl)azetidinone was about $22 \%$.

After the treatment of $\mathbf{4 a}, \mathbf{4 b}$ and $\mathbf{4 c}$ with HCl , the ringopening products underwent catalytic hydrogenation directly by $\mathrm{Pd} / \mathrm{MgCO}_{3}$ or $\mathrm{Pd} / \mathrm{C}$ with nearly $100 \%$ yields. The yields of $\mathbf{5 a}$ and $\mathbf{5 c}$ were $69.8 \%$ and $66.5 \%$ respectively.

Both of the side chain of docetaxel (8a) and its isomer (8c), obtained through hydrolysis of the ester directly, reacted with the parent ring without purification. Side chain $\mathbf{8 a}$ and the parent ring reacted according to the literature [7] to give the docetaxel. Similarly, side chain (8c) of the isomer reacted with the parent ring to afford docetaxel isomer.

Because of the mild cyclization reaction conditions and the convenient asymmetric resolution operation when employing $p$-chlorobenzaldehyde instead of benzaldehyde, the yields of cyclization and hydrogenation increased dramatically. The total yield of docetaxel was higher than that reported in the literature [7]. Considering the high yields and convenient operation, the cost of docetaxel synthesis decreased greatly by this method and will be suitable for
substantive commercial production and provides the foundation for further efforts to increase access to it.

## EXPERIMENTAL

Melting points were determined on RY-1 melting point apparatus and uncorrected. Infrared spectra were recorded on a Hitachi 260-50 spectrophotometer. ${ }^{1} \mathrm{H}$-NMR spectra were measured with a Brucker- 500 MHz spectrometer using TMS as an internal standard. Optical activity was performed using a Perkin-Elmer 241 MC polarimeter. Schiff base of the substituted benzaldehyde was synthesized according to the literature method [6].

## Preparation of $\mathrm{Pd} / \mathrm{MgCO}_{3}$ or $\mathrm{Pd} / \mathrm{C}$ Catalyst.

To a 50 mL flask was added active carbon or $\mathrm{MgCO}_{3}$ and $0.1 \%$ $\mathrm{PdCl}_{2}$ and stirred for 2 h at room temperature until the solution became clear and the color of $\mathrm{MgCO}_{3}$ turned from white to red. After the resulting mixture was filtered, the solid obtained was washed with water and dried to afford fresh $\mathrm{Pd}^{2+}$ catalyst loaded with $\mathrm{MgCO}_{3}$ or carbon black. Then the catalyst was added in 30 mL methanol and pre-activated in the hydrogen atmosphere. The target $\mathrm{Pd} / \mathrm{MgCO}_{3}$ or $\mathrm{Pd} / \mathrm{C}$ catalyst obtained after filtration and drying is red before pre-activation black after pre-activation.

Synthesis of new azetidinone derivatives $\mathbf{4 a}, \mathbf{4 b}$ and $\mathbf{4 c}$.
To a 100 mL three-necked flask were added Schiff base 2 dissolved in 20 mL trichloromethane and triethylamine ( $0.021 \mathrm{~mol}, 2.9$ mL ). The mixture was stirred and cooled to $-5-0{ }^{\circ} \mathrm{C}$, followed by dropwise addition of acetoxyacetyl chloride ( $0.012 \mathrm{~mol}, 1.6 \mathrm{~mL}$ ) in 15 mL of trichloromethane. Then the reaction continued for 2-4 h at room temperature and acidified with 20 mL 2.7 MHCl . The resulting solution was washed twice with water $(20 \mathrm{~mL})$ and the organic layer was separated and dried with $\mathrm{MgSO}_{4}$. After removal of solvent, 3-ester-4-(substitutedphenyl)-2-( $\alpha$-phenylethyl) azetidinone was obtained as a brown viscous solution.
To a 100 mL three-necked flask were added $3 \mathrm{M} \mathrm{KOH}(13 \mathrm{~mL})$ and THF ( 15 mL ), then a mixture of 3-ester-4-(substituted-phenyl)-2-( $\alpha$-phenylethyl) azetidinone and THF ( 9 mL ) was added dropwise at $-1-3{ }^{\circ} \mathrm{C}$. After stirring for 2.5 h , the pH of the resulting solution was adjusted to 9 by addition of 30 mL saturated $\mathrm{NaHCO}_{3}$, and the organic layer was extracted with ethyl acetate ( $20 \mathrm{~mL} \times 3$ ) and dried using $\mathrm{MgSO}_{4}$. After removal of solvent, a yellow solid was obtained. The target product and its isomer were resolved by recrystallization.
(3R,4S)-3-Hydroxy-4-(p-chlorophenyl)-2-( $\alpha$-phenylethyl) azetidinone (4a).

White crystal ( 1.63 g ) was obtained in $50.3 \%$ total yield by recrystallization in a mixture of ethyl acetate and $n$-hexane (5:1). $[\alpha]^{20}{ }_{\mathrm{D}}+158(\mathrm{c} 1.0, \mathrm{MeOH}) ; \mathrm{mp} 141-142.5^{\circ} \mathrm{C}$; IR (KBr) 3260, 2991, 2989, $1723 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right): ~ \delta 7.16-7.58$ (m, $9 \mathrm{H}, \mathrm{Ar}), 5.06(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=4.3 \mathrm{~Hz}, \stackrel{\mathrm{C}}{\mathrm{C}} \mathrm{HOH}), 4.95(\mathrm{~d}, 1 \mathrm{H}$, $\mathrm{J}=4.3 \mathrm{~Hz}, \mathrm{CHN}$ ), $4.55\left(\mathrm{q}, 1 \mathrm{H}, \mathrm{J}=7.17 \mathrm{~Hz}, \mathrm{NCHCH}_{3}\right), 3.51(\mathrm{bs}, 1 \mathrm{H}$, $\mathrm{OH}), 1.45\left(\mathrm{~d}, 3 \mathrm{H}, \mathrm{J}=7.17 \mathrm{~Hz}, \mathrm{CHCH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $500 \mathrm{MHz}): ~ \beta 169.7,139.7,134.9,134.1,130.4,129.2,129.0$, 128.5, 127.6, 77.7, 77.5, 62.0, 52.7.

The Catalytic Ring-opening Reaction and Hydrogenation of $\beta$ Lactams to Obtain Compounds 5a and 5c.

To a 100 mL flask were added $\mathbf{4}(12 \mathrm{mmol})$ and 45 mL of a saturated solution of HCl in methanol. After the mixture was stirred for $3-8 \mathrm{~h}$ and the solvent was removed, the resulting solid was dissolved in water and neutralized by 7.5 M NaOH in an icewater bath. The organic layer obtained by extracting with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $35 \mathrm{~mL} \times 3$ ). After removal of solvent, $\left(2^{*}, 3^{*}\right)$-2-hydroxy-3-[(S)-(1'-phenyl)]amino-3- substituted phenyl-methyl propionate was obtained in $85-95 \%$ yield as yellow liquid.

The catalyst was swollen in 20 mL methanol and 8 mL glacial acetic acid and pre-activated in a hydrogen atmosphere, followed by addition of the ring-opened products $\mathbf{5 a}$ or $\mathbf{5 c}(6 \mathrm{~mL})$. After stirring for 8-12 h at room temperature and in hydrogen atmosphere, the catalyst and solvent were removed, then water and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were added. The resulting mixture was neutralized with $3 N \mathrm{NaOH}$ under stirring in the ice-water bath. Removal of the solvent, from the organic layer, affords a light yellow solid. Recrystallizion with ethyl acetate/isopropyl ether (2/1) gave white lamellar crystal.
( $2 R, 3 S$ )-Methyl 2-Hydroxy-3-amino-3-phenylpropionate (5a).
This compound was obtained in $51.3 \%$ yield; $[\alpha]^{20}{ }_{D}=-22$ ( $\mathrm{C}=1.0, \mathrm{MeOH}$ ) ; mp 103-106 ${ }^{\circ} \mathrm{C}$ (lit. [8] mp:106-108 ${ }^{\circ} \mathrm{C}$ ); $\left.[\alpha]^{20}{ }_{\mathrm{D}}=-22(\mathrm{C}=1.0, \mathrm{MeOH})\right]$; IR (KBr) 3345, 3293 (N-H), 3065 (O-H), 2912 (C-H), 1742 (C=O), 1604 (C=C), 1214, 1171, 1089 (C-O); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 500 \mathrm{MHz}$ ): $\delta 7.20-7.42$ ( m, $5 \mathrm{H}, \mathrm{Ar}$ ), 4.35 (d, $1 \mathrm{H}, \mathrm{CHN} / \mathrm{CHOH}$ ), 4.33 (d, $1 \mathrm{H}, \mathrm{CH} / \mathrm{CHOH}$ ), 3.80 (s, $\left.3 \mathrm{H}, \mathrm{OCH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right): \delta 174.17(\mathrm{C}=\mathrm{O})$, 142.22, 128.98, 128.13, 127.12 (6C, Ar), 75.28, 58.23, 53.07.
( $2 S, 3 R$ )-Methyl 2-Hydroxy-3-amino-3-phenylpropionate (5c).
This compound was obtained in $46.5 \%$ yield; $[\delta]^{20} \mathrm{D}=+30$ (C=1.0, MeOH); mp 112-114 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3345, 3293 (N-H), 3039 (O-H), 2912 (C-H), 1742 (C=O), 1605 (C=C), 1215, 1171, 1089 (C-O); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right): \delta 7.28-7.43$ (m, 5 H ,

Preparation of Docetaxel and its Isomer.
The side chains of docetaxel and its isomer were synthesized by
the hydrolysis of the ester group according to literature method [7] The authors need to put in a detailed procedure for the preparation here. The reference is not enough. Two crude products, $\left(2^{*}, 4 S, 5 R\right)$ $N$-tert-butoxycarbonyl-2-(4'-methoxy)phenyl-4-phenyl-1,3-oxa-zolidine-5-formic acid (8a) and (2*,4R,5S) N-tert-butoxycar-bonyl-2-(4'-methoxy)phenyl-4-phenyl-1,3-oxazolidine-5-formic acid (8c), were obtained. These crude products can be directly reacted in the following steps without purification.

The reaction of the side chain $\mathbf{8 a}$ with the parent ring was carried out according to literature procedure [7]. The docetaxel was obtained and the result was consistent with that in the corresponding reference. The side chain $(\mathbf{8 c})$ of the isomer was reacted with the parent ring in a similar manner to afford the docetaxel isomer in higher yield.
(2*,4S,5R) N-tert-Butoxycarbonyl-2-(4'-methoxy)phenyl-4-phenyl-1,3-oxazolidine-5-formic Acid (8a).

This compound has mp 134~138 ${ }^{\circ} \mathrm{C}$; IR ( KBr ): 3135 (COO$\mathrm{H}), 2977$ ( $\mathrm{C}-\mathrm{H}), 1754(\mathrm{O}=\mathrm{COH}), 1679(\mathrm{O}=\mathrm{CN}) ;{ }^{1} \mathrm{H}$ NMR (DMSO, 500 MHz ): $\delta 11.46$ (br, $1 \mathrm{H}, \mathrm{COOH}), 7.38-6.83(\mathrm{~m}, 9 \mathrm{H}$, Ar), 6.32 (bs, $1 \mathrm{H}, \mathrm{PhCH} / \mathrm{O}=\mathrm{CCH}$ ), 5.14 (bs, $1 \mathrm{H}, \mathrm{PhCH} /$ $\mathrm{O}=\mathrm{CCH}), 4.69(\mathrm{bs}, 1 \mathrm{H}, \mathrm{NCHO}), 3.75\left(\mathrm{bs}, 3 \mathrm{H}, \mathrm{PhOCH}_{3}\right), 0.96(\mathrm{~s}$, $\left.9 \mathrm{H},\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}\right) ;{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 172.2(\mathrm{HOC}=\mathrm{O})$, $160.2(\mathrm{t}-\mathrm{BuOC}=\mathrm{O}), 154.6\left(=\mathrm{CHOCH}_{3}\right), 139.2,132.0,129.3$, 128.3, 127.6, 121.8, 114.9, (6C, Ar), 91.4, 82.3, 81.2, 63.2, 56.5 $\left(\mathrm{ArOCH}_{3}\right), 38.6\left(\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}\right)$.
(2*,4R,5S) N-tert-Butoxycarbonyl-2-(4'-methoxy)phenyl-4-phenyl-1,3-oxazolidine-5-formic Acid (8c).

This compound has mp 129~132 ${ }^{\circ} \mathrm{C}$; IR (KBr): 3134 $(\mathrm{COOH}), 2977(\mathrm{C}-\mathrm{H}), 1753(\mathrm{O}=\mathrm{COH}), 1679(\mathrm{O}=\mathrm{CN}) ;{ }^{1} \mathrm{H}$ NMR (DMSO, 500 MHz ): $\delta 11.48$ (br, 1H, COOH), 7.37-6.80 (m, 9H, Ar), 6.29 (bs, 1H, $\mathrm{PhCH} / \mathrm{O}=\mathrm{CCH}$ ), 5.11 (bs, $1 \mathrm{H}, \mathrm{PhCH} / \mathrm{O}=\mathrm{CCH})$, $4.70(\mathrm{bs}, 1 \mathrm{H}, \mathrm{NCHO}), 3.73\left(\mathrm{bs}, 3 \mathrm{H}, \mathrm{PhOCH}_{3}\right), 0.95(\mathrm{~s}, 9 \mathrm{H}$, $\left.\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right): \delta 172.2(\mathrm{HOC}=\mathrm{O})$, $160.2(\mathrm{t}-\mathrm{BuOC}=\mathrm{O}), 154.6\left(=\mathrm{CHOCH}_{3}\right), 139.2,132.0,129.3$, 128.3, 127.6, 121.8, 114.9, (6C, Ar), 91.4, 82.3, 81.2, 63.2, 56.5 $\left(\mathrm{ArOCH}_{3}\right), 38.6\left(\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}\right)$.

Protection of 10-DAB 9 (Preparation of 10).
10-DAB ( $2 \mathrm{mmol}, 1.09 \mathrm{~g}$ ) was dissolved in pyridine $(16 \mathrm{ml})$ under an $\mathrm{N}_{2}$ atmosphere, 2,2,2-trichloroethyl chloroformate (6.7 $\mathrm{mmol}, 0.85 \mathrm{ml}$ ) was added dropwise at temperature of 0 to $-3^{\circ} \mathrm{C}$ then place the flask was placed in a water bath at 20 to $30^{\circ} \mathrm{C}$, the reaction ended with stirring at $25^{\circ} \mathrm{C}$ for one hour. The reaction mixture was then poured into ice ( 33 g ) after cooling by ice-salt bath, an appropriate quantity of acid was added to neutralize the pyridine, then the mixture was extracted with dichloromethane (3 x 30 ml ), the organic phase was dried with magnesium sulfate and recrystallized in ethyl acetate to afford pure protected 10 DAB; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right): \delta 8.13(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz})$, $7.64(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}), 7.52(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}), 6.31(\mathrm{~s}, 1 \mathrm{H}), 5.66(\mathrm{~d}$, $1 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}), 5.61(\mathrm{~m}, 1 \mathrm{H}), 5.00(\mathrm{~d}, 1 \mathrm{H}), 4.93(\mathrm{~m}, 1 \mathrm{H}), 4.82$ and $4.78(2 \mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=12 \mathrm{~Hz}), 4.92$ and $4.63(2 \mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=12 \mathrm{~Hz}), 4.35$ and $4.18(2 \mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=9 \mathrm{~Hz}), 4.00(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=7 \mathrm{~Hz}), 2.65(\mathrm{~m}, 1 \mathrm{H}), 2.33$ $(\mathrm{m}, 2 \mathrm{H}), 2.33(\mathrm{~s}, 3 \mathrm{H}), 2.19(\mathrm{~s}, 3 \mathrm{H}), 2.10(\mathrm{~m}, 1 \mathrm{H}), 2.05(\mathrm{~m}, 1 \mathrm{H})$, $1.87(\mathrm{~s}, 3 \mathrm{H}), 1.18(\mathrm{~s}, 3 \mathrm{H}), 1.15(\mathrm{~s}, 3 \mathrm{H})$.

Connection of Side Chain and Master Ring (Preparation of 11).
To a 25 ml flask, $10(0.3 \mathrm{mmol}, 0.265 \mathrm{~g}), \mathbf{8 a}$ or $\mathbf{8 c}(0.32 \mathrm{mmol}$, $0.132 \mathrm{~g})$, DCC ( 0.9 mmol ) and DMAP ( 0.06 mmol ) were added
consecutively, followed by 3 ml toluene to dissolve the solid, the reaction was complete after 2 h stirring at room temperature. The mixture then was washed with water $(2 \times 2 \mathrm{ml})$ and dried with anhydrous magnesium sulfate. The solvent was removed by distillation under reduced pressure to afford a pale yellow oil that can be used in the next reaction.

Deprotection of Acetal (Preparation of 12).
Compound 11 ( 0.3 mmol ) PTSA ( 0.33 mmol ) and 15 ml methanol were added to a 25 ml flask and stirred at $25^{\circ} \mathrm{C}$ for 2 h at which time the reaction is complete. Removal of the solvent by distillation gave a white solid, which was then dissolved in 10 ml ethyl acetate, washed with both water and saturated sodium carbonate and dried with anhydrous magnesium sulfate. Crude product $\mathbf{1 2}$ was obtained as yellow oil after distillation of solvent. The oil was purified by flash chromatography (acetate:petrol ether = 1:3) to give $\mathbf{1 2}$ as a white solid.
Deprotection of Hydroxyl (Preparation of Docetaxel and Isomer of Docetaxel).

First, the zinc granules were treated with dilute hydrochloric acid, washed with methanol and dried for further use. Then, compound $\mathbf{1 7}(0.3 \mathrm{mmol})$ was dissolved in 2 ml methanol followed by addition of 0.5 ml acetic acid and three grains of the granulated zinc. The reaction was allowed to proceed at $65^{\circ} \mathrm{C}$ for about 1.5 h . The reaction mixture was filtered to remove the zinc and solid that had formed and the crude product, which was obtained after removal of solvent by distillation, was purified by flash chromatography (elute: acetate:petrol ether =1:1) to afford a white solid in $59 \%$ overall yield.

Docetaxel.
This compound has mp $174 \sim 177{ }^{\circ} \mathrm{C}$; IR ( KBr ): $3434.8(\mathrm{OH}-$ and $\mathrm{NH}_{2}$ ), 2978.2 and $2933.5(\mathrm{C}-\mathrm{H}), 1713.3(\mathrm{O}=\mathrm{C}), 1245.6 ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right): \delta 8.12(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}, \mathrm{Ar}), 7.64$ (t, $1 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}, \mathrm{Ar}), 7.52$ (t, $2 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}, \mathrm{Ar}$ ), 7.43-7.39 (m, 4H, Ar), 7.35-7.34 (m, 1H, Ar), $6.23(\mathrm{~m}, 1 \mathrm{H}), 5.69(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=7 \mathrm{~Hz})$, $5.49(\mathrm{br} \mathrm{d}, 1 \mathrm{H}), 5.29(\mathrm{br} \mathrm{d}, 1 \mathrm{H}), 5.24(\mathrm{~s}, 1 \mathrm{H}), 4.96(\mathrm{~d}, 1 \mathrm{H}$ $\mathrm{J}=9.3 \mathrm{~Hz}), 4.64(\mathrm{br}, 1 \mathrm{H}), 4.33$ and $4.20(\mathrm{dd}, 2 \mathrm{H}, \mathrm{J}=8.5 \mathrm{~Hz}), 4.25$ (dd, 1H), 3.93 (d, 1H, J=7Hz), 3.45 (bs, 1H), 2.63-2.56 (m, 1H), $2.40(\mathrm{~s}, 3 \mathrm{H}), 1.89(\mathrm{~s}, 3 \mathrm{H}), 1.86(\mathrm{~m}, 1 \mathrm{H}), 1.77(\mathrm{~s}, 3 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}$, $\left.\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 1.30(\mathrm{~s}, 3 \mathrm{H}), 1.15(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $(125 \mathrm{MHz}$, DMSO): $\delta 211.4$ ( $\mathrm{C}=\mathrm{O}$ ), 172.8,170.3 ( $\mathrm{C}=\mathrm{O}$ ), 167.1, 155.4 (C=O), 138.5, 135.9, 133.7, 130.2, 129.2, 128.8, 128.7, 128.1, 126.8 (13C of $\mathrm{Cl}-\mathrm{Ph}, \mathrm{Bz}$ and $\mathrm{C}=\mathrm{C}$ ), 84.2, 81.1, 78.8,
