#### Abstract

A series of 1,3,6-trisubstituted and 1,3,5,6-tetrasubstituted pyrazolo[3,4-b]pyridines $\mathbf{5}$ has been synthesized by Friedländer condensation of 5-aminopyrazole-4-carbaldehydes $\mathbf{3}$ with $\alpha$-methylene ketones such as acetone ( $\mathbf{4 a}$ ) or acetophenones $\mathbf{4 b}$-f with potassium hydroxide as basic catalyst. Condensation of 5-aminopyrazole-4-carbaldehydes $\mathbf{3}$ and unsymmetric dialkylketones $\mathbf{6}$ yielded mixtures of isomeric pyra-zolo[3,4-b]pyridine derivatives $\mathbf{7}$ and $\mathbf{8}$. Condensation of 5 -aminopyrazole-4-carbaldehydes $\mathbf{3}$ with CHacidic acylacetonitriles $\mathbf{9}$ and acylacetates $\mathbf{1 1}$ with piperidine as basic catalyst yielded pyrazolo[3,4-b]pyri-dine-5-carbonitriles $\mathbf{1 0}$ and pyrazolo[3,4-b]pyridine-5-carboxylates 12; with diethyl malonate $\mathbf{1 3}$ as CH acidic component, pyrazolo[3,4-b]pyridin-6-ones 14 were obtained.

J. Heterocyclic Chem., 42, 1311 (2005).

Pyrazolo[3,4-b]pyridines as aza-analogues of indazoles [1] are attractive targets in organic synthesis due to their significant biological activities, such as hypoglycemic [2], psychotropic [3], cytotoxic [4] or antiviral [5] activity, and in coronary [6] or neurodegenerative diseases [7]. $o$-Aminoaldehydes are the key intermediates for the synthesis of various biologically active heterocycles e.g. [8,9] using the Friedländer reaction with ketones in a $4+2$ cyclocondensation [10], which prompted us to investigate the reaction pathway of 5-aminopyrazole-4-carbaldehydes with $\alpha$-methylene ketones to new 1,3,6-trisubstituted and 1,3,5,6-tetrasubstituted pyrazolo[3,4-b]pyridines, especially to 1,3,6-triarylpyrazolo[3,4-b]pyridines. A literature survey shows a few reports on the synthesis of pyra-zolo[3,4-b]pyridines using the Friedländer condensation [11], however with substitution patterns different to ours.

The required starting materials for the intended

Friedländer condensation, 5-aminopyrazole-4-carbaldehydes $\mathbf{3}$, were synthesized by cyclocondensation of $p$-substituted aroylacetonitriles, a class of compounds which was studied recently by us for other cyclization reactions [12]. p-Substituted aroylacetonitriles cyclize as 1,3-dicarbonyl synthons with arylhydrazines already on heating without catalysts according to known methods [13] and furnished in good to excellent yields 5-aminopyrazoles 1, which afforded on Vilsmeier-Haack formylation with excess dimethylformamide and phosphoryl chloride 4-formyl-pyrazolyl-dimethylimidoformamides 2. Thermal analysis of formamides 2 by differential scanning calorimetry (DSC) revealed that they are thermally stable compounds which showed thermal decomposition only above $350{ }^{\circ} \mathrm{C}$. Hydrolysis of formamides 2 with refluxing ethanolic sodium hydroxide yielded the required 5-aminopyrazole-4-carbaldehydes $\mathbf{3}$ in good yield.

Scheme 1

The Friedländer condensation of $o$-aminoaldehydes such as 5-aminopyrazole-4-carbaldehydes $\mathbf{3}$ with ketones is described to take place either with strong bases or acids as catalysts; in special cases the ring closure can be observed without a catalyst at higher temperatures (e.g. under microwave irradiation) [10]. We obtained the best results when a mixture of the appropriate 5-aminopyrazole-4-carbaldehyde 3 and the corresponding ketone 4 or 6 were brought to reaction in refluxing ethanolic potassium hydroxide solution. With acetone (4a) or acetophenones $\mathbf{4 b} \mathbf{- f}$, this reaction sequence afforded 6-alkyl-3-aryl and 3,6-diaryl-1-phenylpyrazolo[3,4-b]pyridines 5a-l in good yields.
When instead of the symmetric acetone (4a) or monoalkylketones (4b-f) unsymmetric dialkyl ketones such as 2-butanone (6a) or 4-phenyl-2-butanone ( $\mathbf{6 b}$ ) were used as condensation partner, a mixture of the two expected isomers $\mathbf{7}$ and $\mathbf{8}$ was obtained in a 2:1 ratio; the 5substituted isomer 7 was formed by attack of the carbaldehyde moiety at the ethyl- or benzyl- $\mathrm{CH}_{2}$ group of the ketone 6 , whereas condensation on the alpha-methyl group of $\mathbf{6}$ formed the 5 -unsubstituted isomer $\mathbf{8}$. The mixture of the isomers $\mathbf{7}$ and $\mathbf{8}$ was separated by column chromatography using toluene/hexane as the eluent. Structural assignment of 7a and 8a could easily be performed by ${ }^{1} \mathrm{H} \mathrm{nmr}$,
because 7a shows two methyl singlets at 2.42 and 2.64 ppm , together with the singlet of $4-\mathrm{H}$ at 7.98 ppm , whereas 8a shows the ethyl signal at 1.44 and 2.98 ppm , together with two doublets at 7.14 and 8.21 ppm assigned to the ortho coupled protons $4-\mathrm{H}$ and $5-\mathrm{H}$ of the pyridine ring. All other signals of aromatic protons are nearly identical. Mass spectral analysis of 7a and 8a showed in both cases the same mass of $333(\mathrm{M})$ and $335 \mathrm{~m} / \mathrm{z}\left(\mathrm{M}+2,{ }^{37} \mathrm{Cl}\right.$ isotope), however with other fragmentation patterns: the dimethyl derivative 7a showed as the main fragmentation $297 \mathrm{~m} / \mathrm{z}$ without chloro pattern, which indicates a cleavage of HCl , whereas 8a shows as the first fragmentation 318 $\mathrm{m} / \mathrm{z}$, a cleavage of $\mathrm{CH}_{3}$, together with the fragment 297 $\mathrm{m} / \mathrm{z}$ as observed at 7a. Similarly, the structures of bromo derivatives $\mathbf{7 b}$ and $\mathbf{8 b}$ could be assigned. Compound $\mathbf{7 b}$ shows the methyl singlet at 2.66 and the benzyl- $\mathrm{CH}_{2}$ singlet at 4.20 ppm ; the $4-\mathrm{H}$ signal appeared at 8.07 ppm . The isomer $\mathbf{8 b}$ shows two $\mathrm{CH}_{2}$-multiplets at 3.22-3.27 and 3.32-3.38 ppm, and H-4 and H-5 doublets at 7.11 and 8.23 ppm . The mass spectra of the two isomer bromo derivatives $7 \mathbf{c}$ and $8 \mathbf{c}$ revealed again the identical masses, 377 (M) and $379 \mathrm{~m} / \mathrm{z}$ (M+2, ${ }^{81} \mathrm{Br}$ isotope).

As mentioned above, the Friedländer condensation can be catalyzed by various agents [10]. When we extended

Scheme 2

our synthetic investigations to CH -acidic compounds such as benzoylacetonitriles $\mathbf{9}, \beta$-ketoesters $\mathbf{1 1}$ or diethyl malonate $\mathbf{1 3}$ as keto-component, we found that already piperidine as base was sufficiently strong to catalyze the condensation reaction, which allowed also the preparation of sensitive substituents such as ester groups without decomposition. This method provided a versatile method for the synthesis of various substituted pyrazolo[3,4-b]pyridines and pyrazolo[3,4-b]pyridones with reactive groups in position 5 , ready for further reactions. The cyclocondensation of 5-aminopyrazole-4-carbaldehydes $\mathbf{3}$ with benzoylacetonitriles 9 yielded in ethanolic piperidine pyrazolo[3,4$b$ ]pyridine-5-carbonitriles 10 and $\beta$-ketoesters 11 gave pyrazolo[3,4-b]pyridine-5-carboxylates 12, both structures easily confirmed by nitrile and ester signals. Diethyl mal-
onate (13) afforded under these conditions 5-carbethoxy-pyrazolo[3,4- $b$ ]pyridin-6-ones 14 . The mass spectra and nmr data confirmed the structures of $\mathbf{1 4}$, although the ester carbonyl stretch in the IR could not be observed either in KBr disks or nujol suspension, probably because of hydrogen bonding in the solid state.

The thermal behavior of two pyrazolo[3,4-b]pyridine-5carbonitriles $\mathbf{1 0}$ were investigated by differential scanning calorimetry (DSC) and show above $350{ }^{\circ} \mathrm{C}$ reaction peaks, a reaction temperature too high for synthetic use.

Melting points were determined on a Gallenkamp Melting Point Apparatus, Mod. MFB-595 in open capillary tubes.

Scheme 3

Calorimetric data were obtained on a Rheometric Scientific DSC-Plus instrument with the differential scanning calorimetry software Orchestrator V6.2.2. The differential scanning calorimetry (DSC) plots were recorded between $25-500^{\circ} \mathrm{C}$, with a heating rate of $2-10^{\circ} \mathrm{C} / \mathrm{min}$, and $1.5-3 \mathrm{mg}$ compound in sealed aluminium crucibles ( 11 bar ). The ${ }^{1} \mathrm{H} \mathrm{nmr}$ spectra were recorded on a Varian XL-300 spectrometer ( 300 MHz ), a Bruker AMX 360 instrument ( 360 MHz ) or a Bruker Avance DRX 500 instrument ( 500 MHz ). The ${ }^{13} \mathrm{C}$ nmr-spectra were recorded on a Bruker AM 360 instrument ( 90 MHz ). Chemical shifts are reported in ppm from internal tetramethylsilane standard and are given in $\delta$-units. The solvent for NMR spectra was deuteriochloroform unless otherwise stated. Evaluation of ${ }^{1} \mathrm{H} \mathrm{nmr}$ spectra was performed using the software Mestrec 4. Infrared spectra were taken on a Shimadzu IR-408, a Shimadzu FTIR, or on a Galaxy Series FTIR 7000 instrument in potassium bromide pellets unless otherwise stated. Elemental analyses were performed on a Hosli CH-Analyser or on a Fisons elemental analyzer Mod. EA 1108, and are within $\pm 0.4$ of the theoretical percentages. Mass spectra were taken on a HP 1100 LC/MSD mass spectral instrument (positive or negative APCI: 50-200 eV, nitrogen). All reactions were monitored by thin layer chromatography, carried out on 0.2 mm silica gel $60 \mathrm{~F}-254$ (Merck) plates using uv light (254 and 366 nm ) for detection. Column chromatography was carried out on silica gel (SD Fine Chemicals, 60-80 mesh). Common reagent-grade chemicals are either commercially available and were used without further purification or prepared by standard literature procedures.

## 3-(4-Substituted aryl)-1-phenyl-1 H -pyrazol-5-amines 1a-c.

These compounds were synthesized from $p$-chloro-, $p$-bromoor $p$-methyl-benzoylacetonitrile [12] and phenylhydrazine in excellent yields by refluxing in ethanol for $4-6 \mathrm{~h}$ according to ref. [13].
$N^{\prime}$-[3-(4-Chlorophenyl)-4-formyl-1-phenyl-1 $H$-pyrazol-5-yl]$\mathrm{N}, \mathrm{N}$-dimethylimidoformamide (2a),

To a solution of 3-(4-chlorophenyl)-1-phenyl-1 H -pyrazol-5amine (1a) ( $26.9 \mathrm{~g}, 0.1 \mathrm{~mol}$ ) in dimethylformamide ( $37 \mathrm{~mL}, 0.5$ mol ), phosphoryl chloride ( $46 \mathrm{~mL}, 0.3 \mathrm{~mol}$ ) was added in small portions at $10-15^{\circ} \mathrm{C}$ with stirring. Then the reaction mixture was stirred at $65-70^{\circ} \mathrm{C}$ for 3.5 hours and poured into ice/water ( 900 mL ). The precipitated product was filtered by suction, and washed with water. The yield was $27.5 \mathrm{~g}(78 \%)$ colorless prisms, $\mathrm{mp} 133-134{ }^{\circ} \mathrm{C}$ (ethanol); calorimetric data for the thermolysis: mp at $136.1^{\circ} \mathrm{C}$ onset, $137.7^{\circ} \mathrm{C}$ maximum, $\Delta \mathrm{H}=107 \mathrm{~J} / \mathrm{g}$, decomposition at $346.5^{\circ} \mathrm{C}$ onset, $347.9^{\circ} \mathrm{C}$ maximum, $\Delta \mathrm{H}=-61 \mathrm{~J} / \mathrm{g}$, decomposition at $448.7^{\circ} \mathrm{C}$ onset, $448.9^{\circ} \mathrm{C}$ maximum, $\Delta \mathrm{H}=-451$ $\mathrm{J} / \mathrm{g}$; ir: $1655 \mathrm{~s}, 1615 \mathrm{~m} \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \mathrm{nmr}: \delta 2.86\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 2.97(\mathrm{~s}$, $\mathrm{CH}_{3}$ ), 7.32-7.62 (m, 5 PhH$), 7.63-7.65(\mathrm{~m}, 4 \mathrm{ArH}), 8.48(\mathrm{~s}$, $\mathrm{N}=\mathrm{CH}), 9.52$ ( $\mathrm{s}, \mathrm{CH}=\mathrm{O}$ ).

General Procedure for the Preparation of 3-(4-Halophenyl)-1-phenyl-1 $H$-pyrazolo[3,4-b]pyridines 7 and $\mathbf{8}$.

A mixture of the appropriate pyrazolecarbaldehyde $\mathbf{3}$ ( 2 mmol ), the corresponding ketone $4(2 \mathrm{mmol})$ and ethanolic potassium hydroxide solution ( $10 \mathrm{~mL}, 2 \%$ ) was heated under reflux for one hour. A colorless solid precipitated and was filtered by suction. It contained two compounds according to tlc analysis ( $\mathrm{R}_{\mathrm{f}}$ values: 0.95 and 0.73 in toluene). This mixture was dissolved in acetone and separated by column chromatography ( $18 \times 300 \mathrm{~mm}$, eluent toluene/hexane 5:100, eluation volume for 7: $400-420 \mathrm{~mL}$, for 8 : $240-260 \mathrm{~mL}$ ); detection by tlc analysis ( 254 nm ).
