

New 2-pyrone derivatives, dialkyl 3-cyano-6-phenyl-2-oxo-2H-pyran-4-ylmalonates and alkyl 3-cyano6 -phenyl-2-oxo- 2 H -pyran-4-ylacetates, which were easily prepared by the reaction of 6 -aryl-4-methyl-sulfanyl-2-oxo- 2 H -pyran-3-carbonitriles with active methylene compounds in the presence of potassium carbonate, show fluorescence emission radiation. The light-emitting region of dimethyl 3-cyano-6-(4-N,N-dimethylamino)styryl-2-oxo-2H-pyran-4-ylmalonate (7h) was 620 nm in dichloromethane, making this compound a typical red fluorescent compound. Methyl 8-hydroxy-6-methyl-1-oxo-3-phenyl-1 H -pyrano-[3,4-c]pyridine-5-carboxylate deriv-atives also showed fluorescence in the solid state. This is the first example of fluorescence in fused 2-pyrone derivatives.
J. Heterocyclic Chem., 45, 265 (2008).

## INTRODUCTION

Pyrones and fused pyrones are important in designing luminescent materials for organic light-emitting diodes (OLED), dye lasers, and luminescent labeling reagents for HPLC or capillary electrophoresis [1]. 2H-Pyrones containing aryl groups at position 6 continue to attract considerable attention in both synthetic and materials chemistry, and are highly interesting materials for applications in optoelectronic devices such as displays [2]. It has been reported that 6-aryl- or styryl-4-methyl-sulfanyl- 2 H -pyrones are easily prepared by the reaction of ketene dithioacetal with active methylene compounds in the presence of powdered sodium [3] and the resulting compounds are also useful synthetic intermediates for 6-aryl- and 6-styryl-4-alkoxy- or 4-amino-2-oxo-2 H -pyran3 -carbonitriles $[4,5]$. In the field of organic electron luminescence, a red color is most desired. Compound 4-(dicyanomethylene)-2-methyl-6-(4-dimethylaminostyryl)$4 H$-pyran (DCM) and other 4 H -pyran derivatives are important and well-known red materials in organic EL substances [6,7]. To prepare our final target compound 7h possessing red fluorescence, we The previous procedure for preparing 3a-l can be applied to 6-styryl-2H-pyrones. The reaction of 4 -( $\mathrm{N}, \mathrm{N}$-disubstitutedaminophenyl)but-3-
en-2-ones ( $\mathbf{2 m} \mathbf{- o}$ ) with synthesized 2 H -pyrone derivatives bearing an active methylene group at the 4 position by the displacement of a 4-methylsulfanyl group with active methylene compounds.

## RESULTS AND DISCUSSION

Synthesis of $\mathbf{2 H}$-Pyrones and Fused $\mathbf{2 H}$-Pyrone. The 2 H -pyrone derivatives (3a-l) used in this study were easily prepared by the reaction of the corresponding aryl acetyl compounds (2a-l) with ketene dithioacetal (1a) [4b,d]. Methyl 6-aryl-4-methylsulfanyl-2-oxo-2H-pyran-3-carboxylates (4a-d) were also prepared from $\mathbf{1 b}$ and arylacetyl compounds ( $\mathbf{2 a}, \mathbf{c}, \mathbf{f}, \mathbf{l}$ ). Because compounds 4a-d were not very active against nucleophiles, the

4-sulfinyl compounds 5a-c, obtained by the oxidation of 5a-c with $m$-chloroperbenzoic acid or hydrogen peroxide, were used in the reaction with active methylene compounds (See Figure 2).

Figure 2

The previous procedure for preparing 3a-l can be applied to 6 -styryl-2H-pyrones. The reaction of $4-(\mathrm{N}, \mathrm{N}$ disubstituted aminophenyl)but-3-en-2-ones (2m-o) with methyl 3,3-bis(methylsulfanyl)-2-cyanoacrylate (1a) was carried out in the presence of sodium hydroxide as the base to give the desired products, 6 -[2-(4- $N, N^{\prime}$-disubstituted aminophenyl)vinyl]-4-methylsulfanyl-2-oxo2 H -pyran-3-carbonitriles ( $\mathbf{3 m - 0}$ ) in 32,26 , and $29 \%$ yields, respectively (Scheme 1).

Scheme 1

It is well known that the reaction of ketene dithioacetals with active methylene compounds smoothly progresses in the presence of potassium carbonate as a base to give the corresponding mono-substituted products in good yield. The reaction of compound $\mathbf{3}$ with active methylene compounds was carried out under these experimental conditions. The reaction of $\mathbf{3 a}, \mathbf{c}, \mathbf{g}, \mathbf{j}$, and $\mathbf{l}$ with methyl or ethyl malonates $(\mathbf{6 a}, \mathbf{b})$ in the presence of potassium

Table 2. Synthesis of Dialkyl 3-Methoxycarbonyl-6-phenyl-2-oxo-2H-pyran-4-ylmalonates.

Table 3. Synthesis of $\mathbf{1 H}$-pyrano[3,4-c]pyridines

carbonate in DMSO gave the corresponding dialkyl 3-cyano-6-phenyl- or 6-styryl-2-oxo-2H-pyran-4-yl-malonates ( $\mathbf{7 a}-\mathrm{h}$ ) in $72-97 \%$ yields, respectively (shown in Table 1).

Similarly, dialkyl 3-methoxycarbonyl-6-phenyl-2-oxo2 H -pyran-4-ylmalonates ( $7 \mathbf{i}-\mathrm{m}$ ) were readily obtained from 6-aryl-4-sulfinyl-2H-pyran-2-ones (5a-c) and active methylene compounds ( $\mathbf{6 a}, \mathbf{b}$ ) in good yields (shown in Table 2).
On the other hand, the reactions of $\mathbf{3 a} \mathbf{c}, \mathbf{d}, \mathbf{e}, \mathbf{g}$ with methyl or ethyl acetoacetates ( $\mathbf{6 c}, \mathbf{d}$ ) under the same reaction conditions did not give the corresponding displacement products 7a-e. The products of these reactions were determined to be 8-hydroxy-6-methyl-3-phenyl-1-oxo-1H-pyrano[3,4-c]pyridine-5-carboxylates
(8a-h) (in Table 3) by spectroscopic (IR, UV, NMR, and MS) and elemental analyses. In the NMR spectra of 8a-h, the hydroxy protons at position 8 appear at $12.0-12.5 \mathrm{ppm}$ due to hydrogen bonding with a $\mathrm{O}=\mathrm{C}$ group. In the case of $\mathbf{8 i}$ and $\mathbf{f}$, the hydroxy protons were not shown due to strong hydrogen bonds in the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra. In the final step of this reaction, the reaction mixture was acidified with $10 \% \mathrm{HCl}$ solution and then the intermediates, e.g., $\mathbf{3}$, were treated with concentrated HCl to give separable mixtures of $\mathbf{8}, \mathbf{9}$, and $\mathbf{1 0}$. These compounds were easily separated by their differential solubilities in solvents such as dichloromethane, DMF, and ethanol to give compounds $\mathbf{8}, \mathbf{9}$ and $\mathbf{1 0}$, respectively. The structures of these compounds were determined by spectroscopic (IR, NMR, UV, and MS) and elemental

analyses. The reaction pathway of each product $(\mathbf{8}, \mathbf{9}, \mathbf{1 0})$ is shown in Scheme 2.

proceeds first with carbon nucleophilic attack at position 4, followed by displacement of the methylsulfanyl group to give the corresponding 4 -substituted 2 -pyrone derivatives. Electron donating and accepting substituents are recognized as molecular subunits that display non-linear optical properties due to their high polarizability. These molecules not only exhibit optical properties but also display diverse pharmacological activities. Ram et al. have reported the synthesis of biaryl compounds by the reaction of 2 H -pyrone derivatives (3) with malononitrile in the presence of potassium hydroxide [8]. This reaction proceeds initially by carbanion attack at position 6 with ring opening followed by ring transformation to yield biaryl compounds. While this reaction conveniently synthesizes polyfunctionalized biaryl compounds, the yield is low. We reexamined our reaction conditions to increase the yield of products. Compound 3a was allowed to react with malononitrile ( $\mathbf{6 f}$ ) in the presence of powdered sodium hydroxide in DMSO at room temperature for 5 hours. The reaction mixture was poured +into a large amount of water and stirred at room temperature for about 12 hours until nso more products precipitated. The product was recrystallized from methanol to give colorless needles, mp 240-242 ${ }^{\circ}$, in $85 \%$ yield. The structure of this compound was determined to be 4-amino-5-methylsulfanyl-biphenyl-2,4-di-carbonitrile (11a), which was identical spectroscopically with the compound prepared by Ram. Similarly, other new biphenyl compounds ( $\mathbf{1 1 b} \mathbf{- j}$ ) were synthesized from the corresponding 4-methylsulfanyl-2-oxo-2H-pyran-3-carbonitriles ( $\mathbf{3 b} \mathbf{b} \mathbf{d ,} \mathbf{f}, \mathbf{4 a - c}$ ) and $\mathbf{6 f}$ under similar reaction conditions. In reactions of $\mathbf{4 a} \mathbf{b}$, and $\mathbf{c}$ with $\mathbf{6 f}, 3$-amino-biphenyl-4-carboxylates (11a-j) were also obtained in 73$99 \%$ yield (see Table 5).

Fluorescence properties. The UV-vis absorption and fluorescence emission radiation of the 4 -substituted 2 -oxo- 2 H -pyran-3-carbonitriles and 3-carboxylates and fused 2 H -pyrones were analyzed. DCM and $\mathrm{AlQ}_{3}[\operatorname{tris}(8-$ hydroxy-quinolinato)aluminum] were used as standards for absorption and fluorescence spectra. The measurements of both absorption and fluorescence spectra were
performed in dichloromethane and ethanol solutions at room temperature. The spectroscopic properties, absorption maxima $\left(\lambda_{\max }\right)$, molar absorptivities $(\varepsilon)$, fluorescence maxima ( $\mathrm{E}_{\mathrm{m}}$ max) and relative fluorescent intensities (RI) are described in part of Experimental. The aryl and styryl moieties bearing $N, N$-disubstituted amino groups at position 6 of the 2-pyrone derivatives fulfill the important condition for fluorescent expression. Compounds (31-m) showed longer wavelength shifts in comparison with the most basic 2-pyrone, 4-methyl-sulfanyl-6-phenyl-2-oxo-2H-pyan-3-carbonitrile (3a). However, their relative fluorescence intensities have a tendency to decrease, while the $\varepsilon$ values increase in the absorption spectra. In general, 4-amino-6-aryl-2-oxo-2H-pyran-3-carbonitriles show stronger intensity than the corresponding 4 -methylsulfanyl compounds and their light-emission regions show a $40-50 \mathrm{~nm}$ blue shift. On the other hand, 4 -substituted compounds ( 7 and 9) show a small batho-chromic shift and stronger fluorescence emission radiation than that of compound $\mathbf{3}$ in the solid state. In particular, the light-emitting region of compound 7h was 620 nm in dichloromethane, making this compound a typical red fluorescent compound (See Figure 3). Compounds 7e, f also showed red fluorescence in ethanol solution and can be used as a fluorescence reagent in an oxalate chemiluminescence system.

Figure 3. Comparison og fluorescent intensity of 2 H pyrone with that of DCM in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution.

The fluorescence emission radiation of fused pyrones such as compounds $\mathbf{8}$ and $\mathbf{9}$ were analyzed. The $1 H$ -pyrano[3,4-c]pyridin-1-one derivatives (8) exhibit moderately strong fluorescent radiation, while the $1 \mathrm{H}, 8 \mathrm{H}$ -pyrano[3,4-c]pyran-1,8-dione derivatives (9) did not show
appreciable fluorescence emission radiation in the solid state. In a similar case with compound 3, 3-phenyl pyrano[3,4-c]pyridin-1-one bearing electron-donating groups such as a methoxy group on the phenyl group showed strong fluorescence. For example, ethyl 8-hydroxy-3-(2,4-dimethoxyphenyl)-6-methyl-1-oxo-1 H -pyrano[3,4-c]pyridine-5-carboxylate (8e) showed fluorescence emission radiation at 490 nm with a relative intensity of 4.88 in the solid state. The reason why the fluorescence of these chemical compounds increases seems to be the strong packing by the flat molecules due to hydrogen bonding of a $-\mathrm{C}=\mathrm{O}---\mathrm{H}-\mathrm{O}-$ system. This fact suggests the possibility of developing fluorescence in other fused 2 H -pyrone derivatives. Biaryl derivatives (11a-j) showed weak fluorescence emission radiation in the solid state.

In conclusion, new 2-pyrone derivatives, dialkyl 3-cyano-2-oxo-6-phenyl-2H-pyran-4-ylmalonates and alkyl 3-cyano-2-oxo-6-phenyl-2H-pyran-4-ylacetates, which were easily prepared by the reaction of 6 -aryl-4-methyl-sulfanyl-2-oxo- 2 H -pyran-3-carbonitriles with active methylene compounds in the presence of potassium carbonate, show fluorescence emission radiation. Methyl 8-hydroxy-6-methyl-1-oxo-3-phenyl-1 H -pyrano[3,4-c]-pyridine-5-carboxylate derivatives also showed fluorescence in the solid state. This is the first example of fluorescence in fused 2-pyrone derivatives.

## EXPERIMENTAL

#### Abstract

Identifications of compounds and measurements of properties were carried out by general procedures using the following equipment. All melting points were determined in a capillary tube and are uncorrected. The infrared (IR) spectra were recorded in potassium bromide pellets on JASCO 810 or Shimazu IR-460 spectrometer, and the ultraviolet (UV) absorption spectra were determined in $95 \%$ ethanol on a Hitachi 323 spectrometer. The fluorescence spectra were determined on Shimazu RF-1500. The nuclear magnetic resonance (NMR) spectra were obtained on Gemini 300NMR ( 300 MHz ) and $500 \mathrm{NMR}(500 \mathrm{MHz})$ spectrometers with tetramethylsilane as an internal standard. The mass spectra (MS) were recorded on JEOL DX-303 mass spectrometers. Microanalyses were performed by Y. Ohwatari on a Perkin Elmer 2002 at Nagasaki University. All chemicals were reagent grade and used without further purification unless otherwise specified.

## Method of Measurement of Fluorescence.

In solid states. A powder sample of subject compound is heaped in the tray. After covering the sample with quartz plate, this part was fixed in fluorescence spectrometer. After fixing the fluorescent wavelength, the excitation spectrum was determined by the scanning with the fluorescent wavelength. Similarly, Fluorescent spectrum was obtained after scanning with the excitation wavelength. After obtaining these results, the excitation wavelength was decided and the fluorescence spectrum was measured.

The fluorescent relative intensity was determined by using $\mathrm{AlQ}_{3}$ as standard sample. Fluorescence of standard sample and all subject compounds were measured on 272 nm excitation.

In solution. The concentration of measuring samples in the excitation wavelength region was adjusted under 0.05 on the molar absorption. The fluorescence spectra in solution were obtained in a manner similar to that described for the measurement in the solid states. Relative intensity of fluorescence in solution was determined by using DCM as a standard compound. Fluorescence of standard sample and all subject compounds were measured on 366 nm excitation.

6-(4-N,N-Dimethylamino)styryl-4-methylsulfanyl-2-oxo-2H-pyran-3-carbonitrile (3m). A mixture of $1.89 \mathrm{~g}(10 \mathrm{mmoles})$ of $\mathbf{2 l}, 2.03 \mathrm{~g}$ ( 10 mmoles ) of $\mathbf{1 a}, 0.8 \mathrm{~g}$ ( 20 mmoles ) powdered sodium hydroxide, and 40 ml of DMSO was stirred at room temperature for 1 hour. The reaction mixture was poured into 500 ml of ice-water and stirred at room temperature for 2 hours. The brown precipitates that appeared were collected by filtration, washed with water, and recrystallized from a mixture of dichloromethane and methanol to give 0.998 g ( 3.20 mmoles, $32 \%$ yield) of black violet leaflets, mp 280-284; ir(potassium bromide) $v \mathrm{~cm}^{-1}: 2202(\mathrm{CN}), 1705(\mathrm{C}=\mathrm{O}), 1595,1560,1465$, $1360,1162)$; uv(EtOH) $\lambda \mathrm{nm}(\log \varepsilon): 253$ (4.19), 309 (4.29), 374 (3.67), 397 (3.64), 513 (4.67); fluorescence (EtOH):Ex: 366 nm ; Em: $624 \mathrm{~nm} .\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right):$ Ex: $541 \mathrm{~nm}, \mathrm{Em}: 612 \mathrm{~nm}: \mathrm{RI}=1.25$. ${ }^{1} \mathrm{H}$ $\mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta: 2.65(\mathrm{~s}, 3, \mathrm{SMe}), 3.10\left(\mathrm{~s}, 6,2 \times \mathrm{NMe}_{2}\right), 6.12(\mathrm{~s}, 1,6-$ H), $6.44(\mathrm{~d}, 1,=\mathrm{CH}, \mathrm{J}=15.7 \mathrm{~Hz}), 6.72\left(\mathrm{~d}, 2,3\right.$ ', $\left.5^{\prime}-\mathrm{H}, \mathrm{J}=9.1 \mathrm{~Hz}\right)$, $7.48\left(\mathrm{~d}, 2,2^{\prime}, 6^{\prime}-\mathrm{H}, \mathrm{J}=9.1 \mathrm{~Hz}\right), 7.68$ (d, 2, =CH, J=15.7 Hz); ms: $\mathrm{m} / \mathrm{z} 312\left(\mathrm{M}^{+}, 100\right)$, 284(6), 241(5), 209(15), 174(16), 44(35). Dimethyl 6-Benzo[1,3]dioxol-5-yl-3-methoxy-carbonyl-2-oxo-2H-pyran-4-ylmalonate ( 7 m ). This compound $(0.429 \mathrm{~g}$, 1.06 mmoles) was synthesized in $53 \%$ yield from $5 \mathrm{c}(0.673 \mathrm{~g}$, 2.0 mmoles) and $6 \mathbf{a}(0.528 \mathrm{~g}, 4 \mathrm{mmoles})$ in manner similar to that described for the preparation of $\mathbf{7 i}$. An analytical sample was recrystallized from methanol to give yellow needles, mp 143-146 ${ }^{\circ}$; ir(potassium bromide) $v_{\max } \mathrm{cm}^{-1}: 1780$ (CO), 1735 (CO), $1680(\mathrm{CO}), 1620,1600 ; \mathrm{uv}(\mathrm{EtOH}) \lambda_{\text {max }} \mathrm{nm}(\log \varepsilon): 244$ (4.27), 249 (4.28), 254 (4.29), 383 (4.36); fluorescence (solid): Ex, 331 nm ; Em, $504 \mathrm{~nm} ; \mathrm{RI}=0.87 ;{ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta: 3.82(\mathrm{~s}, 6$, $2 x \mathrm{OMe}), 3.96(\mathrm{~s}, 3, \mathrm{OMe}), 5.20(\mathrm{~s}, 1,-\mathrm{CH}-), 6.06\left(\mathrm{~s}, 2, \mathrm{O}_{\mathrm{CH}}^{2}-\right.$ O), 6.76 (s, 1, 5-H), 6.89 (d, 1, J=8.3 Hz, 5'-H), $7.30\left(\mathrm{~d}, 1,2^{\prime}-\mathrm{H}\right.$, $\mathrm{J}=1.8 \mathrm{~Hz}), 7.45(\mathrm{dd}, 1,6$ '-H, J=1.8, 8.3 Hz$) ; \mathrm{ms} \mathrm{m} / \mathrm{z}: 404\left(\mathrm{M}^{+}\right.$, 100), 376 (41), 373 (22), 344 (43), 341 (21), 290 (43)0, 258 (46), 190 (44), 149 (93). Anal. Calcd. for $\mathrm{C}_{19} \mathrm{H}_{16} \mathrm{O}_{10}: \mathrm{C}, 56.44$; H, 3.99. Found: C, 56.68; H, 3.79.

Methyl 8-Hydroxy-6-methyl-1-oxo-3-phenyl-1H-pyrano-[3,4-c]pyridine-5-carboxylate (8a). Potassium carbonate ( 0.691 $\mathrm{g}, 5.0$ mmoles) was added to the soulution of $\mathbf{3 a}(0.487 \mathrm{~g}, 2.0$ mmoles) and methyl acetoacetate ( $\mathbf{6 c}$ )( $0.464 \mathrm{~g}, 4.0 \mathrm{mmoles}$ ) in 20 ml of DMSO. After stirring at room temperature for 2 hours, the reaction mixture was poured into 200 ml of ice water and then acidified with $10 \%$ hydrochloric acid. The caramel oil product that appeared was collected by decantation and washed several tomes with water. This crude product was dissolved in 100 ml of methanol and this methanol solution was refluxed for 2 hours. After removal of the solvent by rotary evaporation, the residue was crystallized by treating with $10 \sim 20 \mathrm{ml}$ of methanol. The resulting precipitate was collected by filtration and recrystallized from methanol to give $0.324 \mathrm{~g}(1.04 \mathrm{mmoles})$ of 8a as pale yellow crystals, $\mathrm{mp}>300^{\circ}$, in $52 \%$ yield. ir(potassium bromide) $v_{\text {max }} \mathrm{cm}^{-1}: 3450(\mathrm{OH}, \mathrm{br}), 1755(\mathrm{CO}), 1710(\mathrm{CO})$, 1648, 1620, 1585, 1530; uv(EtOH) $\lambda_{\text {max }} \mathrm{nm}(\log \varepsilon): 268$ (5.23), 346 (5.23); fluorescence (solid): Ex, 345 nm ; Em, 462 nm ; $\mathrm{RI}=1.23$; ${ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}+\mathrm{CF}_{3} \mathrm{COOH}\right) \delta: 2.62$ (s, 3, 6-Me), 4.03 (s, 3, OMe), 7.41 (s, 1, 4-H), 7.44-7.59 (m, 3, phenyl-H), 7.85$7.92\left(\mathrm{~m}, 2\right.$, phenyl-H); ms m/z: $312\left(\mathrm{M}^{+}+1,40\right), 311\left(\mathrm{M}^{+}, 100\right)$,

8-Hydroxy-6-methyl-3-(4-methoxyphenyl)-1H-pyrano[3,4-c]pyridine-1-one ( $\mathbf{8 j}$ ). This compound ( $0.470 \mathrm{~g}, 1.66$ mmoles was prepared in $83 \%$ yeld from $3 \mathrm{~b}(0.547 \mathrm{~g}, 2.0$ mmoles) and $\mathbf{6 f}$ $(0.400 \mathrm{~g}, 4.0 \mathrm{mmoles})$ in a manner similar to that described from the preparation of $\mathbf{8 a}$. An analytical sample was recrystallized from methanol to give pale yellow needles $\mathrm{mp}>323^{\circ}$; $\operatorname{ir}\left(\right.$ potassium bromide) $v v_{\max } \mathrm{cm}^{-1}: 3450(\mathrm{OH}, \mathrm{br}), 1760(\mathrm{CO})$, 1590, 1510; uv(EtOH) $\lambda_{\text {max }} \mathrm{nm}(\log \varepsilon): 271$ (4.34), 363 (4.57); fluorescence (solid): Ex, 337 nm ; Em, $495 \mathrm{~nm} ; \mathrm{RI}=0.40 ;{ }^{1} \mathrm{H}$ $\operatorname{nmr}\left(\mathrm{CDCl}_{3}\right) \delta: 2.25$ ( $\left.\mathrm{s}, 3, \mathrm{Me}\right), 3.84$ (s, 3, OMe ), 6.12 (s, 1, 5H), 7.03 (s, 1, 4-H), $7.10\left(\mathrm{~d}, 2, \mathrm{~J}=8.8 \mathrm{~Hz}, 3^{\prime}, 5^{\prime}-\mathrm{H}\right), 7.86(\mathrm{~d}, 2$, $\left.\mathrm{J}=8.8 \mathrm{~Hz}, 2^{\prime}, 6^{\prime}-\mathrm{H}\right) ; \mathrm{ms} \mathrm{m} / \mathrm{z}: 284\left(\mathrm{M}^{+}+1,18\right), 283\left(\mathrm{M}^{+}, 100\right), 255$ (70), 212 (18), 135 (16), 127 (14), 77 (12). Anal. Calcd. for $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{NO}_{4}: \mathrm{C}, 67.84 ; \mathrm{H}, 4.63 ; \mathrm{N}, 4.94$. Found: C, $67.55 ; \mathrm{H}$, 4.65; N, 4.89.

The reaction of 6-Aryl-3-cyano-2H-pyran-2-ones (3a-c, e) with active methylene compounds ( $6 c, d, f$ ). Potassium carbonate ( $0.691 \mathrm{~g}, 5.0 \mathrm{mmoles}$ ) was added to the soulution of 3a ( $0.487 \mathrm{~g}, 2.0 \mathrm{mmoles}$ ) and $\mathbf{6 c}(0.464 \mathrm{~g}, 4.0 \mathrm{mmoles})$ in 20 ml of DMSO. This mixture was stirring at room temperature for 2 hours, poured into 200 mL of ice water and then acidified with $10 \%$ hydrochloric acid. The product that appeared was collected by decantation and washed several times with water. The crude product was dissolved in a solution of 150 ml of ethanol and 10 ml of concentrated -HCl solution. The solution was refluxed for 30 min . After removal of the solvent by rotary evaporation, the residue was crystallized by treatment with $10 \sim 20 \mathrm{ml}$ of ethanol. The resulting precipitate was collected by filtration and washed with 50 mL of dichloromethane. This compound (8a) was recrystallized from DMF to give coloreless needles, mp $>300^{\circ}$. Dichloromethane in the above filtrate was removed by rotary evaporation to give 10a which was easily purified by recrystallization with ethanol. In the reaction of $\mathbf{3 a}$ with $\mathbf{6 d}$ under similar reaction conditions, a separable mixture of $\mathbf{8 c}, \mathbf{9 a}$, and 10b was obtained, which was easily separated by recrystallization with ethanol. Though compound 9a was not so soluble in ethanol, compound 10b was easily solved in ethanol. Compound 9a was recrystallized from DMF to give pure compound, mp 152-155 ${ }^{\circ}$, for elemental analysis. Compound 10b was easily recrystallized from ethanol to give pale yellow needles, mp 145-147 ${ }^{\circ}$. The yields of each products were shown in Table 4.

Ethyl 1,8-Dioxo-3-methyl-6-phenyl-1H,8H-pyrano-[3,4-c]-pyran-4-carboxylate (9a). This compound (0.072g, 0.22 mmole) was obtained $11 \%$ yield by the above method from 3a ( $0.487 \mathrm{~g}, 2.0 \mathrm{mmoles}$ ) and $\mathbf{6 d}(0.521 \mathrm{~g}, 4.0 \mathrm{mmoles})$ to give pale yellow leaflets $\mathrm{mp} 152-155^{\circ}$; ir(potassium bromide) $v_{\max } \mathrm{cm}^{-1}$ : 1780 (CO), 1705 (CO), 1623, 1585, 1575; uv(EtOH) $\lambda_{\max }$ $\mathrm{nm}(\log \varepsilon): 261$ (4.45), 334 (4.39), 359 (4.30); fluorescence (solid): Ex, 337 nm ; Em, $457 \mathrm{~nm} ; \mathrm{RI}=0.82 ;{ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta$ :

Methyl 6-Amino-4-benzo[1.3]dioxol-5-yl-5-cyano-2-(sulfanyl)benzoate (11j). This compound ( $0.507 \mathrm{~g}, 1,47 \mathrm{mmoles}$ ) was prepared in $74 \%$ yield from $\mathbf{4 c}(0.64 \mathrm{~g}, 2.0$ mmoles) and $\mathbf{6 h}(0.3$
$\mathrm{g}, 4.0$ mmoles) in a manner similar to that described for the preparation of 11a. An analytical sample was re-crystallized from DMF to give colorless needles; mp 196-198 ${ }^{\circ}$; ir (potassium bromide) $v_{\text {max }} \mathrm{cm}^{-1}: 3464(\mathrm{NH}), 3352(\mathrm{NH}), 2208(\mathrm{CN}), 1676$ (CO), 1564, 1503, 1274, 1243.; uv(EtOH) $\lambda_{\text {max }} \mathrm{nm}(\log \varepsilon): 254$ (4.51), 316 (4.18), 368 (4.12); ${ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right)$ ): 2.44 (s, 3, SMe), 3.97 ( $\mathrm{s}, 3, \mathrm{OMe}$ ), 6.04 ( $\mathrm{s}, 2, \mathrm{O}-\mathrm{CH}_{2}-\mathrm{O}$ ), 6.41 (brs, 2, $\mathrm{NH}_{2}$ ), 6.49 (s, 1, 6-H), 6.91 (d, 1, $5^{\prime}-\mathrm{H}, \mathrm{J}=8.2 \mathrm{~Hz}$ ), $7.00\left(\mathrm{~d}, 1,2^{\prime}-\right.$ H, J=1.6 Hz), 7.04 (dd, 1, $6 '-H, J=1.6,8.2 \mathrm{~Hz}$ ); ms m/z: 343 $\left(\mathrm{M}^{+}+1,9\right), 342\left(\mathrm{M}^{+}, 43\right), 311(10), 310(24), 262(96), 234(100)$. Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}: \mathrm{C}, 59.64 ; \mathrm{H}, 4.12 ; \mathrm{N}, 8.18$. Found. C, 59.66 ; H, $4.11 \mathrm{~N}, 8.09$.
