The syntheses of novel thieno-pyridones, thiazolo-pyridones, thiazolo-pyridines and amino- and diamino-dieno-pyridines were described. Simultaneously, it was demonstrated that in these compounds and in the related 3 -aminothiophenes the replacement of the methylthio by the morpholino group is possible. The structures were characterized using ${ }^{1} \mathrm{H}-,{ }^{13} \mathrm{C}$-NMR, IR and elemental analysis.

## INTRODUCTION

In general the ZIEGLER-THORPE Cyclization [1] is designated as a intramolecular addition of a nitrile group on a activated methylene group, represented for example in Figure 1: with $\mathrm{A}, \mathrm{B}=$ carbon or hetero atoms, $\mathrm{X}, \mathrm{Y}=$ electron acceptors.

Figure 1

This reaction was used by us several times before for the preparation of amino-5-cycle-heterocycles [1], and herein cited literature, [2]. In the following we have tried to synthesize instantaneously condensed heterocycles by application of suitable reagents in one step or two steps.

## RESULTS AND DISCUSSION

Mainly we are interested in the use of polyfunctional $\alpha$ halogen compounds: Potassium-(2,2-dicyano-1-methyl-thioethen-1-yl)thiolate $\mathbf{1}[3,4]$ was reacted with 3 -amino-2-chloracetyl-but-2-en-carbo-nitrile 2 [5] in boiling EtOH to give the thiophene derivative $\mathbf{3}$, which formed the
sparingly soluble thieno-pyridone $\mathbf{4}$ by acid catalysis. The structure was determined by ${ }^{1} \mathrm{H}$ NMR and mass spectrometry. Treatment of $\mathbf{3}$ with morpholine gives, via nucleophilic substitution of the methylthio group, the morpholino-thiophene 5 (see Scheme 1).

Scheme 1

In the same manner, potassium-methyl-cyan-imidodithiocarbonate 6 [6] reacted with 2 to form the 2-methylthiothiazole 7. In presence of acid the reaction resulted in the thiazolo-pyridone $\mathbf{8}$, whereas after treatment of 7 with NaOEt an nucleophilic substitution with formation of its ethoxy derivative 9 was observed (see Scheme 2).

## Scheme 2

6
2
7

A further option was the reaction of sodium $N$-phenyl-$N^{\prime}$-cyano-imido-thiocarbonate $\mathbf{1 0}$ [7] with 2 (see Scheme 3). After formation of the 4 -amino-thiazole $\mathbf{1 1}$ the cyclization with acid to the thiazolo-pyridone $\mathbf{1 2}$ occured by elimination of ammonia. By reaction of 3-brommethyl-2-cyan-cinnamo-nitrile $\mathbf{1 3}$ [8] with $\mathbf{1 0}$ the diamino-thiazolo-pyridine 14 immediately was formed. Compound 13 (mp $118^{\circ} \mathrm{C}$ ) was obtained from 2-cyan-3-methyl-cinnamo-nitrile [9] in boiling benzene with N -bromosuccinimide having been added.

## Scheme 3

The direct cyclization to form the methylthio-thienopyridine 16 was achieved by the reaction of $\mathbf{1}$ with $\mathbf{1 3}$. The intermediate 3 -amino-thiophene derivative $\mathbf{1 5}$ could not be obtained. The nucleophilic substitution of $\mathrm{CH}_{3} \mathrm{~S}$ by the morpholino group lead to the thieno-pyridine 17 (see

Scheme 4). To replace the methylthio group again compare thioglucolic ester [10].

Scheme 4

The replacement of malonitrile by cyanamide in the reaction of Potassium methylcyan-imido-dithiocarbonate $\mathbf{6}$ with the bromo-compound $\mathbf{1 3}$ yielded the substituted 4-amino-thiazole 18. Beside the ring closure via the aminnitrile treatment with morpholine gave an nucleophilic substitution of the methylthio group at the thiazole ring, and the thiazolo-pyridine $\mathbf{1 9}$ was isolated (see Scheme 5).

Furthermore the replacement of the $\mathrm{CH}_{3} \mathrm{~S}$ group by morpholine or piperidine could be applied to the THORPE products 4-amino-5-benzoyl-2-methylthio-thiophen-3-carbonitriles 21 and resulted in the morpholino-thiophenes 22 (see Scheme 6).

In analogy to Wobig [11], the 4-amino-5-acyl-2-(4-morpholinyl)-thiazoles $\mathbf{2 4}$ were formed from the corresponding 2-methylthio-thiazoles 23 (Scheme 7).

## EXPERIMENTAL

The corrected melting points were measured on a Kofler hotstage apparatus. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were obtained in DMSO- $d_{6}$ using the Bruker AC-300 and DRX-500 spectrometers. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts are reported in ppm downfield from TMS as an internal standard. Multiplicities in the: ${ }^{13} \mathrm{C}$ gated decoupling NMR spectra are given as a result of ${ }^{13} \mathrm{C}-{ }^{1} \mathrm{H}$ coupling over 2 or 3 bonds. The IR spectra were recorded on a spectrophotometer Specord 75 (Fa. Carl Zeiss Jena). Elemental analyses were determined on an EA 1108 (Fa. Carlo Erba Hofheim), the MS spectra by the HP Bruker Esquire LC-MS System.
