#### Abstract

A series of new unsymmetrical 3-phenyl-6-benzyl-1,2,4,5-tetrazine derivatives 10a-i were synthesized and characterized by IR, NMR, MS, and element analysis. The structures of $\mathbf{4 a}, \mathbf{1 0 c}, \mathbf{1 0 d}$ and $\mathbf{1 0 h}$ were analyzed by X-ray crystallography, which had intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}, \mathrm{C}-\mathrm{H} \cdots \Pi$ and $\Pi \cdots \Pi$ interactions. J. Heterocyclic Chem., 45, 1745 (2008).

## INTRODUCTION

Compounds containing the 1,2,4,5-tetrazine skeleton can be used as dyes [1], herbicides [2], and antibacterial [3]. In addition, recently, some 1,2,4,5-tetrazine derivatives have been found with good antitumor activity by our research team [4-8]. Although some synthesis and crystallographic studies of 1,2,4,5-tetrazine have been published [9], only a few of them referred to unsymmetrical 3,6-disubstituted-1,2,4,5-tetrazines [10], which is due to the difficulty and troublesome work in separation and purification of unsymmetrical 3,6-disubstituted-1,2,4,5-tetrazines.

According to Lang's method [10a,b], the traditional way to synthesize unsymmetrical 3,6-disubstituted-1,2,4,5-tetrazines is as follows: ethyl ( $p$-substituted) iminobenzoate hydrochloride $\mathbf{1 a - d}$ and acetamidine hydrochloride 2 were reacted with hydrazine hydrate to form dihydro-1,2,4,5-tetrazines 3a-d, a series of somewhat unstable compounds, which were then easily oxidized by sodium nitrite and acetic acid to obtain corresponding unsymmetrical 3-(substitutedphenyl)-6-methyl-1,2,4,5-tetrazines 4a-d (Scheme I). However, when using this method to prepare 3-phenyl-6-benzyl-1,2,4,5-tetrazine, the yield was very low ( $<5 \%$ ), the main product we obtained was 4-amino-3-benzyl-5-phenyl-1,2,4-trizole 6, which may have been formed by the isomerization of 3-phenyl-6-benzyl-1,4-dihydro-1,2,4,5tetrazine 5 under acid conditions [11] (Scheme II) .

In this contribution we want to report about a facile preparation of a series of new unsymmetrical 3-phenyl-6-benzyl-1,2,4,5-tetrazine derivatives.

Scheme II

## RESULTS AND DISCUSSION

Synthesis. The synthetic procedures of our new unsymmetrical 3-phenyl-6-benzyl-1,2,4,5-tetrazine derivatives 10a-i are shown in scheme III. The $p$-substituted benzonitrile $\mathbf{7 a} \mathbf{a}$ and $p$-substituted benzylcyanide $\mathbf{8 a - i}$ were reacted with $85 \%$ hydrazine hydrate in the presence of sulfur powder, to initially form 3-(p-substituted-phenyl)-6-p-(substitutedbenzyl)-1,4-dihydro-1,2,4,5-tetrazine $9 \mathbf{9 - i}$, which were then easily oxidized by sodium nitrite and acetic acid to obtain 3-phenyl-6-benzyl-1,2,4,5-
tetrazine derivatives 10a-i. In addition to 10a-i, this reaction also caused other two series of products: symmetrical 3,6-disubstituted phenyl-1,2,4,5-tetrazines and 3,6-disubstituted benzyl-1,2,4,5-tetrazine, which were formed by $\mathbf{7 a - i}$ and $\mathbf{8 a - i}$, respectively. When the reaction performed in the absence of sulfur powder, product 10a was not detected even when the reaction time was prolonged from 3 hours to 10 hours. When the molar ratio of 7a-8a-sulfur was $1: 1: 1$, the yield of $\mathbf{1 0 a}$ was $33.8 \%$. By increasing the amount of sulfur power and changing the molar ratio of 7a-8a-sulfur to 1:1:2, the yield of 10a decreased to $28.2 \%$. These results showed that adding a suitable amount of sulfur powder had a significant effect on the yield of 10a.

From these results the reaction conditions we choose were 7a-i ( 25 mmol ), 8a-i ( 25 mmol ), sulfur powder ( 25 mmol ), and $85 \%$ hydrazine hydrate ( 10 mL ). Using this reaction system, a series of new unsymmetrical 3-phenyl-6-benzyl-1,2,4,5-tetrazine derivatives 10a-i were synthesized. The results are summarized in Table 1. From the Table, it can be seen that, for 10a-i, when $\mathrm{R}_{2}$ are the same, the yields increase with the enhancement of electron withdrawing ability of $\mathrm{R}_{3}$ group $\left(\mathrm{Cl}>\mathrm{H}>\mathrm{OCH}_{3}\right)$. On the contrary, when $R_{3}$ are the same, the yields decrease with the enhancement of electron withdrawing ability of $\mathrm{R}_{2}$ group ( $\mathrm{H}>\mathrm{Cl}>\mathrm{CF}_{3}$ ).

## Scheme III

| $\mathbf{1 0 h}$ | Cl | $\mathrm{OCH}_{3}$ | 19.1 |
| $\mathbf{1 0 i}$ | Cl | Cl | 30.2 |

${ }^{\alpha}$ all yields are based on $\mathbf{7 a - i}$ (or $\mathbf{8 a - i}$ ).

Crystal structures. The selected bond lengths and angles for compounds $\mathbf{4 a}, \mathbf{1 0} \mathbf{c}$-d and $\mathbf{1 0 h}$ are given in Table 3. Parameters for data collection and refinement of $\mathbf{4 a}, \mathbf{1 0 c - d}$ and $\mathbf{1 0 h}$ are summarized in Table 4. It should be noted that, although the synthesis of $\mathbf{4 a}$ have been reported [13], the crystal structure has not previously been presented. The ORTEP view of 4a with atom numbering scheme is shown in Figure 1. It is obvious that the tetrazine ring $\mathrm{N} 1-\mathrm{C} 6$ (centroid Cg 1 ), the phenyl ring $\mathrm{C} 8-$ C 13 (centroid Cg 2 ) and the C 7 atom are almost coplanar, the crystal packing (Figure 2) exhibits weak $\Pi-\Pi$ stacking interaction, proved by the short distance $\mathrm{Cg} 1 \cdots \mathrm{Cg} 2^{\mathrm{i}}$ of 3.758 (3) $\AA$. [symmetry codes: (i) $1-\mathrm{x}, 1-\mathrm{y}, 1-\mathrm{z}$ ]. The $\mathrm{C} \cdots \mathrm{C}$ distance is within the range associated with $\Pi-$ $\Pi$ interactions [3.3-3.8 Å] [12].

Figure 1. ORTEP view of compound $\mathbf{4 a}$ with atom numbering scheme. Ellipsoids are drawn at the $50 \%$ probability level (arbitrary spheres for H atoms).

Figure 2. The packing diagram of compound $\mathbf{4 a}$ view along the a axis.

The atom-labelling schemes of compound 10 c and 10 d are shown in Figure 3. It is clear to see that $\mathbf{1 0 c}$ and $10 d$ have similar crystal structure. The central tetrazine rings N1-C6 of 10c and 10d are almost coplanar with the phenyl rings $\mathrm{C} 14-\mathrm{C} 19$ and $\mathrm{C} 7-\mathrm{C} 12$, with the dihedral angles of $2.46(3)^{\circ}$ and $5.90(2)^{\circ}$, respectively, but twisted with respect to the benzyl-phenyl rings C8-C13 and C15C20, with the dihedral angles of $69.40(3)^{\circ}$ and $76.70(2)^{\circ}$,

10c

10d

Figure 3. ORTEP view of compounds 10c and 10d with atom numbering schemes. Ellipsoids are drawn at the $30 \%$ probability level (arbitrary spheres for H atoms). For $\mathbf{1 0 d}$, only the major component of the disordered $\mathrm{CF}_{3}$ group is shown.
respectively. The central bond lengths C3-C14 in molecule 10c and C3-C7 in molecule 10d are 1.469(4) $\AA$ and $1.462(4) \AA$, respectively, which are similar to that of C3-C8 in $\mathbf{4 a}[1.461(3) \AA$ ]. The packing diagram of $\mathbf{1 0} \mathbf{c}$ is shown in Figure 4, which indicates the weak $\mathrm{C}-\mathrm{H}---\mathrm{N}$ hydrogen bonding occurs between neighboring molecules (Table 5).

Figure 4. The packing diagram of compound 10c view along the $b$ axis (the dotted line representing $\mathrm{C}-\mathrm{H}---\mathrm{Cl}$ hydrogen bonding).

The ORTEP view of $\mathbf{1 0 h}$ with atom numbering scheme is shown in Figure 5. Compound 10h crystallizes with two crystallographically independent molecules in the asymmetric unit that differ in the orientation of the methoxy group. In both molecules the chlorophenyl ring is almost coplanar with the central tetrazine ring, but the methoxyphenyl ring is twisted. $\mathrm{C} 7-\mathrm{C} 12$ and $\mathrm{C} 14-\mathrm{C} 19$ benzene rings make dihedral angles of $2.32(3)^{\circ}$ and $76.74(2)^{\circ}$, respectively, with the central tetrazine ring N1C6. The C27-C37 and C34-C39 benzene make dihedral angles of $2.32(3)^{\circ}$ and $80.47(2)^{\circ}$, respectively, with the central tetrazine ring N21-C26.

In the crystal structure (Figure 6), a C-H---Cl hydrogen bonding is observed between the two independent molecules, pair of $\mathrm{C}-\mathrm{H}--\Pi$ interactions involving the C34C39 ring (centroid Cg1) link the molecules into a dimer(Table 6).

Figure 5. ORTEP view of compound $\mathbf{1 0 h}$ with atom numbering scheme. Ellipsoids are drawn at the $30 \%$ probability level (arbitrary spheres for Hatoms).

Figure 6. The packing diagram of compound $\mathbf{1 0 h}$ view along the a axis (the dotted line representing $\mathrm{C}-\mathrm{H}---\mathrm{Cl}$ hydrogen bonding).

In conclusion, we have adopted two different methods to prepare some unsymmetrical disubstituted-1,2,4,5tetrazines $\mathbf{4 a - d}$ and $\mathbf{1 0 a} \mathbf{- i}$. The structures of 4a, 10c, 10d and 10 h were analyzed by X-ray crystallography, and these X-ray data may be helpful to find out the potential drug-enzyme interactions between these compounds and some tumor receptors, which we are studying on.

## EXPERIMENTAL

Solvents and reagents were commercially available and used without further purification. Melting points were measured on an XRC-1 apparatus and are uncorrected. Infrared spectra were

General Procedure for the Synthesis of 10a-i. Under a $\mathrm{N}_{2}$ atmosphere, $85 \%$ hydrazine hydrate ( $10 \mathrm{~mL}, 170 \mathrm{mmol}$ ) was added dropwise to an anhydrous ethanol solution ( 15 mL ) of $p$-substituted benzyl cyanide ( 25 mmol ) 8a-i and $p$-substituted benzonitrile ( 25 mmol ) 7 a-i at 298 K with existing sulfur powder ( $0.8 \mathrm{~g}, 25 \mathrm{mmol}$ ). After refluxing for 3 h , the mixture was cooled to room temperature and the resulting yellow solid product was collected by filtration. The solid product was then dissolved in diethyl ether ( 15 mL ); to this solution was added 10 mL aqueous solution of sodium nitrite ( $1.0 \mathrm{~g}, 14 \mathrm{mmol}$ ) and was then added dropwise of 8 mL aqueous solution of acetic acid $(0.9 \mathrm{~g}, 14 \mathrm{mmol})$. After standing for 4 h , the purple precipitate was collected and washed with cold anhydrous ethanol ( 5 mL ), which was then chromatographed on a silica gel column using cyclohexane-dichloromethane (V/V, 4:1) as the eluent. The first eluting material, a pink crystal, was 3,6-di(p-substituted phenyl)-s-tetrazine. The second one, a red crystal, was 3 - $p$-substituted phenyl)-6-( $p$-substituted benzyl)-s-tetrazine 10a-i; the third one, a red crystal, was $3,6-\mathrm{di}(p-$ substituted benzyl)-s-tetrazine.

Crystal Structure Determination. Single-crystal X-ray stucuture determination were made on crystal of molecule 4a, 10c-d and 10h. Data collection for the block-shaped single crystals of $\mathbf{4 a}, \mathbf{1 0 c} \mathbf{- d}$ and $\mathbf{1 0 h}$ was performed on a Bruker CCD system with graphite monochromated Mo $\mathrm{K} \alpha$ radiation ( $\lambda=$ $0.71073 \AA$ ) at 293 K . The model type of the diffractometer was CCD area detector. The sizes of the crysrals used for data collection were $0.25 \times 0.20 \times 0.15 \mathrm{~mm}^{3}$ for $\mathbf{4 a}, 0.25 \times 0.20 \times 0.20$ $\mathrm{mm}^{3}$ for $\mathbf{1 0 c}, 0.30 \times 0.25 \times 0.20 \mathrm{~mm}^{3}$ for $\mathbf{1 0 d}$, and $0.25 \times 0.20 \times 0.15$ $\mathrm{mm}^{3}$ for $\mathbf{1 0 h}$. The structure was solved by direct methods and refined on $\mathrm{F}^{2}$ using SHELXTL software. Anisotropic thermal parameters were applied for all the non-hydrogen atoms. All hydrogen atoms were positioned geometrically and refined as riding, with C-H distances of $0.97(2) \AA$ and with $U_{\text {iso }}(\mathrm{H})=1.2 U \mathrm{eq}(\mathrm{C})$. Crystallographic parameters and agreement factors are contained in Table 4. CCDC-634552, 621205, 642406 and 642405 contain the supplementary crystallographic data for this paper. These data can be obtained free of charge at www.ccdc.cam.ac.uk/conts/retrieving.html or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB2 1EZ, UK [Fax: +44-1223/336-033; Email: depoist@ccdc.cam.ac.uk].
3-Phenyl-6-benzyl-1,2,4,5-tetreazine(10a). Red prism, yield: 2.1 g . mp: 112~113 ${ }^{\circ} \mathrm{C}\left(110 \sim 111^{\circ} \mathrm{C}\right.$ [14]). IR (KBr, $\left.\mathrm{cm}^{-1}\right): 3064$ (Ar-H), $2926\left(\mathrm{CH}_{2}\right), 1385(\mathrm{C}=\mathrm{N}), 1089 .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right)$ $\delta 8.57$ (d, $2 \mathrm{H}, \mathrm{J}=9.2 \mathrm{~Hz}$ ), 7.58-7.66 (m, $3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}$ ), 7.48 (d, 2 $\mathrm{H}, \mathrm{J}=8.0 \mathrm{~Hz}$ ), 7.29-7.38 (m, 3 H, Ar-H), 4.62 ( $\mathrm{s}, 2 \mathrm{H}$ ), 3.78 ( $\mathrm{s}, 3$ H). MS (m/z, \%): 248 ( $\mathrm{M}^{+}, 10$ ), 117 (90), 103 (98), 90 (36), 76 (42).

3-Phenyl-6-(4-methoxybenzyl)-1,2,4,5-tetreazine (10b). Red prism, yield: $1.5 \mathrm{~g} . \mathrm{mp}: 120 \sim 123^{\circ} \mathrm{C}$. $\mathrm{IR}\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right): 3066$ (Ar-H), $2937\left(\mathrm{CH}_{2}\right), 2837\left(\mathrm{CH}_{3}\right), 1381(\mathrm{C}=\mathrm{N}), 1247,1089 .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, ppm) $88.57(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=6.8 \mathrm{~Hz}), 7.55-7.61(\mathrm{~m}, 3$ $\mathrm{H}, \operatorname{Ar}-\mathrm{H}), 7.37(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}), 6.87(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz})$, 4.62 (s, 2 H ), 3.78 ( $\mathrm{s}, 3 \mathrm{H}$ ). MS (m/z, \%): 278 ( $\mathrm{M}^{+}$, 17), 238 (92), 147 (80), 135 (67), 121 (25), 103 (100), 91 (7), 77 (57). Anal. Calcd. for $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{~N}_{4} \mathrm{O}$ (278.31): C, $69.05 ; \mathrm{H}, 5.07$; N , 20.13. Found: C, 68.78; H, 5.13; N, 20.06.

3-Phenyl-6-(4-chlorobenzyl)-1,2,4,5-tetreazine (10c). Red prism, yield: $2.8 \mathrm{~g} . \mathrm{mp}: 143 \sim 145^{\circ} \mathrm{C}$. $\mathrm{IR}\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right): 3054$ ( $\mathrm{Ar}-$ $\mathrm{H}), 2937\left(\mathrm{CH}_{2}\right), 1384(\mathrm{C}=\mathrm{N}), 1088,740(\mathrm{Ar}-\mathrm{Cl}) .{ }^{1} \mathrm{H}$ NMR
$\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 8.58(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=6.8 \mathrm{~Hz}), 7.57-7.63(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}-$ H), $7.40(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.0 \mathrm{~Hz}), 6.87(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.0 \mathrm{~Hz}), 4.65(\mathrm{~s}, 2$ H).
