The carbodiimides 5, obtained from reactions of iminophosphorane 4 with aromatic isocyanates, reacted with amines, phenols or ROH to give 2 -substituted $5,6,7,8$-tetrahydropyrido $\left[4^{\prime}, 33^{\prime}: 4,5\right]$ thieno $[2,3-d]$ -pyrimidin- $4(3 H)$-one 7 in the presence of catalytic amount of sodium alkoxide or solid potassium carbonate in satisfactory yields.
J. Heterocyclic Chem., 45, 1809 (2008).

## INTRODUCTION

The derivatives of heterocycles containing pyrido-thieno-pyrimidine system possess a broad spectrum of biological activities. They proved to be significant antipyretic [1], anti-inflammatory $[2,3]$ and antiallergic activities [4]. Also some of these compounds show good $5-\mathrm{HT}_{1 \mathrm{~A}}$ agonistical [5] or phosphodiesterase $\mathrm{PDE7}_{\mathrm{B}}$ inhibitive activities [6]. The chemistry of pyridothienopyrimidinones have also received attention because their starting materials, 2-amino-3-carboxythiophenes, can be conveniently synthesized by Gewald reaction [7]. Synthetically useful approaches to pyridothienopyrimidines starting from easily accessible 2-amino-3carboxythiophenes are therefore of great importance. Recently we have become interested in the preparation of N -heteroaryl iminophosphoranes because these species are promising building blocks for the synthesis of nitrogen heterocycles [8-11]. Herein we wish to report an efficient synthesis of new 2-substituted 5,6,7,8-tetrahydropyrido $\left[4^{\prime}, 3^{\prime}: 4,5\right]$ thieno[2,3- $d$ ]pyrimidin- $4(3 H)$-one derivatives via iminophosphorane 4.

## RESULTS AND DISCUSSION

The ethyl 2-amino-4,5,6,7-tetrahydrothieno[2,3-c] pyridine-3-carboxylate 3, easily obtained by Gewald method from piperidinone 2 [12], ethyl cyanoacetate and sulfur in the presence of morpholine, was converted to iminophosphorane 4 by treatment with triphenyl phosphine, hexachloroethane and triethylamine in dry acetonitrile (Scheme I).

Scheme I

1
2

Iminophosphorane 4 reacted with an equimolecular quantity of the aromatic isocyanates to give the carbodiimides 5, which were allowed to react with aliphatic amines to provide guanidine intermediates $6\left(Y=N R^{1} R^{2}\right)$. Even in refluxing toluene, the intermediates 6 did not cyclize. However, by treatment with sodium ethoxide in ethanol at room temperature, the intermediates 6 underwent intramolecular heterocyclization to give the expected 2-amino-5,6,7,8-tetrahydropyrido[4',3':4,5]-thieno-[2,3-d]pyrimidin-4(3H)-ones 7 in satisfactory yields (Scheme II). The results are listed in Table I.

The direct reaction of carbodiimide 5 with phenols did not produce 2 -aryloxy $5,6,7,8$-tetrahydropyrido[ $\left.4^{\prime}, 3^{\prime}: 4,5\right]$ thieno[2,3-d]pyrimidin- $4(3 H)$-ones 7 either. However, when carried our in the presence of catalytic amount of potassium carbonate, the reaction took place to give $7(\mathrm{Y}=\mathrm{OAr})$ in good yields (Table I). The formation

[a] Isolated yields based on iminophosphorane 4.
of 7 can be rationalized in terms of an initial nucleophilic addition of phenoxides to the carbodiimides 5 to give the intermediates 6 which cyclize to give 7. The direct reaction of carbodiimide 5 with ROH gave a complex mixture, however, when the reaction was carried out in the presence of catalytic amount of $\mathrm{RO}^{-} \mathrm{Na}^{+}$, the reaction took place smoothly and 2-alkoxy $5,6,7,8$-tetrahydro pyrido $\left[4^{\prime}, 3^{\prime}: 4,5\right]$ thieno $[2,3-d]$ pyrimidin- $4(3 H)$-ones 7 (Y = OR) were obtained in satisfactory yields (Table I).

The structure of the synthesized compound 7 was confirmed by their spectral data and elemental analyses. For example the ${ }^{1} \mathrm{H}$ NMR spectral data of $7 \mathbf{7 a}$ show signals for $-\mathrm{NCH}_{2}$ at $2.86-2.94 \mathrm{ppm}$ as multiplets, signals of $\mathrm{NCH}_{3}$ at 1.98 ppm as singlet and signals of $\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}$ at $0.80-1.20 \mathrm{ppm}$ as multiplets. The tetrahydropyridine ring's

signals appeared at $4.43 \mathrm{ppm}(8-\mathrm{CH})$ as singlet and 3.10$3.65 \mathrm{ppm}(5,6-\mathrm{CH})$ as multiplets. The phenyl signals
appeared at 7.22-7.53 ppm. The MS spectrum of 7a shows molecule ion peak $\left(\mathrm{M}^{+}\right)$at $\mathrm{m} / \mathrm{z} 604$ with $31 \%$ abundance.
In conclusion, we have developed an efficient synthesis of 2-substituted 5,6,7,8-tetrahydropyrido $\left[4^{\prime}, 3^{\prime}: 4,5\right]$ thieno-[2,3- $d$ ]pyrimidin- $4(3 H)$-ones via reaction of functionalized carbodiimides with various amine, phenols or alcohols. Due to the easily accessible and versatile starting material, this method has potential in the synthesis of many biologically and pharmaceutically active pyridothienopyrimidinone derivatives.

## EXPERIMENTAL

Melting points were determined using a X-4 model apparatus and are uncorrected. MS were measured on a Finnigan Trace MS spectrometer. NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on a Varian Mercury Plus $400(400 \mathrm{MHz})$ spectrometer and chemical shifts ( $\delta$ ) were given in ppm using $\left(\mathrm{CH}_{3}\right)_{4} \mathrm{Si}$ as an internal reference ( $\delta=0$ ). IR spectra were recorded on a PE-983 infrared spectrometer as KBr pellets with absorption in $\mathrm{cm}^{-1}$. UV spectra were recorded on a SCINCO UV S-3100 spectrometer. Elementary analyses were taken on a Vario EL III elementary analysis instrument.
Ethyl 2-amino-5,7-diphenyl-6-methyl-4,5,6,7-tetrahydro-thieno[2,3-c]pyridine-3-carboxylate (3). To a stirred mixture of 1.33 g ( 0.005 mole ) of piperidinone (2) [12], 0.16 g ( 0.005 mole) of sulfur, $0.57 \mathrm{~g}(0.005$ mole $)$ of ethyl cyanoacetate in 20 mL of ethanol, was added 1.2 mL of morpholine. After the mixture was stirred at $35^{\circ} \mathrm{C}$ for 48 hours, the solid was collected by filtration and recrystallized from ethanol to give $\mathbf{3}$ as light yellow needles, $1.25 \mathrm{~g}(64 \%)$, mp 195-197ㅇ ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ $1.22(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.89(\mathrm{~s}, 3 \mathrm{H}), 2.98-3.57(\mathrm{~m}, 3 \mathrm{H}), 4.20(\mathrm{q}$, $\mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 4.25(\mathrm{~s}, 1 \mathrm{H}), 5.88(\mathrm{~s}, 2 \mathrm{H}), 7.25-7.47(\mathrm{~m}, 10 \mathrm{H})$; MS: m/z (\%) 392 ( $48, \mathrm{M}^{+}$), 315 (50), 269 (30), 198 (18), 118 (100), 91 (30). Anal. Calcd. for $\mathrm{C}_{23} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}: \mathrm{C}, 70.38 ; \mathrm{H}, 6.16$; $\mathrm{N}, 7.14$. Found: C, 70.15 ; $\mathrm{H}, 6.23$; $\mathrm{N}, 7.35$.

Ethyl 5,7-diphenyl-6-methyl-2-(triphenylphosphoranyli-dene)amino-4,5,6,7-tetrahydrothieno [2,3-c]pyridine-3-carboxylate (4). To a mixture of ethyl 2 -amino-5,7-diphenyl-6-methyl-4,5,6,7-tetrahydro-thieno[2,3-c]pyridine-3-carboxylate (3) $(3.14 \mathrm{~g}, 8 \mathrm{mmol}), \mathrm{PPh}_{3}(3.14 \mathrm{~g}, 12 \mathrm{mmol})$ and $\mathrm{C}_{2} \mathrm{Cl}_{6}(2.84 \mathrm{~g}$, 12 mmol ) in dry $\mathrm{CH}_{3} \mathrm{CN}(40 \mathrm{~mL})$, was added dropwise $\mathrm{NEt}_{3}$ $(2.42 \mathrm{~g}, 24 \mathrm{mmol})$ at room temperature. The color of the reaction mixture quickly turned yellow. After stirring for 4 h , the solvent was removed under reduced pressure and the residue was recrystallized from EtOH to give iminophosphorane 4 as light yellow needles, 4.33 g (83\%), mp 218-219 ${ }^{\circ}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.24(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.85(\mathrm{~s}, 3 \mathrm{H}), 3.02-3.54(\mathrm{~m}$, $3 \mathrm{H}), 4.16(\mathrm{q}, \mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 4.23(\mathrm{~s}, 1 \mathrm{H}), 7.19-7.75(\mathrm{~m}, 25 \mathrm{H})$; MS: m/z (\%) 652 ( $48, \mathrm{M}^{+}$), 606 (63), 487 (100), 436 (23), 316 (10), 274 (23). Anal. Calcd. for $\mathrm{C}_{41} \mathrm{H}_{37} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{PS}: \mathrm{C}, 75.44 ; \mathrm{H}$, 5.71 ; N, 4.29. Found: C, 75.68 ; H, 5.58; N, 4.32.

General Preparation of 2-Amino-5,6,7,8-tetrahydro pyrido[4',3':4,5]thieno[2,3-d]pyrimidin-4(3H)-ones (7a-7m). To a solution of iminophosphorane $4(1.30 \mathrm{~g}, 2 \mathrm{mmol})$ in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added aromatic isocyanate (2 mmol ) under nitrogen atmosphere at room temperature. After the reaction mixture was left unstirred for $6-12 \mathrm{~h}$ at $0-5^{\circ} \mathrm{C}$, the iminophosphorane 4 had disappeared (TLC monitored). The
solvent was removed under reduced pressure and $\mathrm{Et}_{2} \mathrm{O}$ / petroleum ether ( $1: 2,20 \mathrm{~mL}$ ) was added to precipitate triphenylphosphine oxide. Removal of the solvent gave carbodiimides 5, which were used directly without further purification. To the solution of $\mathbf{5}$ in dichloromethane ( 10 mL ) was added aliphatic amine ( 2 mmol ). After the reaction mixture was left unstirred for $5-6 \mathrm{~h}$, the solvent was removed and anhydrous EtOH ( 10 mL ) with several drops of EtONa in EtOH was added. The mixture was stirred for $6-8 \mathrm{~h}$ at room temperature. The solution was condensed and residue was recrystallized from EtOH to give the expected cyclic compouds 7a-7m in good yields.

2-Di(n-pentyl)amino-7-methyl-3,6,8-triphenyl-5,6,7,8-tetra hydropyrido $\left[4^{\prime}, 3\right.$ ':4,5]thieno $[2,3-d]$ pyrimidin-4(3H)-one (7a). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.80-1.20(\mathrm{~m}, 18 \mathrm{H}), 1.98(\mathrm{~s}, 3 \mathrm{H}), 2.86-2.94$ $(\mathrm{m}, 4 \mathrm{H}), 3.10-3.65(\mathrm{~m}, 3 \mathrm{H}), 4.43(\mathrm{~s}, 1 \mathrm{H}), 7.22-7.53(\mathrm{~m}, 15 \mathrm{H})$; ir (potassium bromide): $1680(\mathrm{C}=\mathrm{O}), 1542,1376,1214 \mathrm{~cm}^{-1}$; uv: $\lambda \max 302 \mathrm{~nm} ; \mathrm{MS}: \mathrm{m} / \mathrm{z}(\%) 604$ (31, M$\left.{ }^{+}\right), 484$ (42), 359 (100), 318 (32), 274 (52), 218 (10).
