

A new class of bis heterocycles having two different heterocyclic rings viz., pyrroles in combination with pyrazolines and isoxazolines were synthesized. All the compounds were characterized by elemental and spectral analysis.
J. Heterocyclic Chem., 47, 825 (2010).

## INTRODUCTION

Heterocyclic chemistry has attracted a lot of interest during recent years as many useful drugs have emerged in this branch. In fact, the development of simple, facile, and efficient synthetic methodologies for the development of five membered heterocycles has been a challenging task in organic synthesis. Amongst five membered heterocycles, pyrroles, pyrazoles, and isoxazoles have gained importance because of their varied physiological activities. As constituents of cytotoxic drugs, such as netrospin and distamycin, 4-aminopyrrole-2-carboxylates, have been used as the main compounds in the construction of a diverse series of DNA-binding ligands exhibiting antibiotic, antiviral, and oncolytic properties [1]. The related 3-amino pyrroles also exhibit anticonvulsant activity by blocking sodium channels [2]. In addition, pyrazolines and isoxazolines have gained importance due to their various chemotherapeutic properties. In fact, Celecoxib, a pyrazole derivative and Valdecoxib, an isoxazole derivative, have been widely used in the market as anti-inflammatory drugs [3]. Hence, it was considered worthwhile to prepare molecules having both pyrrole and pyrazole/isoxazole rings. In the literature, 3,4-disubstituted pyrroles were reported either by coupling imines and nitroalkanes or by using FriedelCraft's acylation in the presence of an electron-withdrawing group on the pyrrole nitrogen or on 3,4-silylated precursors [4]. However, these synthetic routes
were often complicated and limited to only some substituents. Previously, 3,4-disubstituted pyrroles were synthesized from Michael acceptors and tosylmethyl isocyanide (TosMIC) [5]. Following this synthetic methodology, we have reported recently a new regioselective one step procedure using phenyl vinyl sulfone, aryl styryl sulfones, benzyl styryl sulfones and TosMIC, leading to a series of 3,4-disubstituted pyrroles in good yields [6]. Similarly, pyrazolines and isoxazolines were prepared by 1,3-dipolar cycloaddition of an ylide to an alkene involving the $3+2$ cycloaddition principle [7]. Among the ylides, diazomethane, nitrile imines, and nitrile oxides were used extensively as reactive intermediates. These nitrile imines and nitrile oxides can be generated by the dehydrogenation of araldehyde phenylhydrazones and araldoximes with lead tetraacetate [8], mercury acetate [9], 1-chlorobenzotriazole [10], chlor-amine-T [11] etc. Use of the latter for in situ generation of dipolar reagents has enthused many organic chemists. In fact, we have reported the 1,3-dipolar cycloaddition reaction of Chloramine-T catalysed dipolar reagents with variety of activated mono and bis(olefins) [12]. Apart from these, bis heterocycles, bis pyrroles and pyrrolyl pyrazoles were prepared from 1-arylsulfonyl-2styrylsulfonyl ethenes by 1,3-dipolar cycloaddition methodology [13]. The present communication deals with the synthesis of hitherto unknown sulfonelinked bis (heterocycles) having pyrrole together with pyrazole or

isoxazole units, from 1,3-dipolar cycloaddition of TosMIC, nitrile imines and nitrile oxides to sulfonyl activated olefins.

## RESULTS AND DISCUSSION

The synthetic scheme was based on the reactivity of $E, E$-bis(styryl)sulfone (1) towards 1,3-dipolar reagents viz., TosMIC, diazomethane, nitrile imines and nitrile oxides. When 1 was treated with TosMIC in the presence of sodium hydride in a mixture of ether and dimethylsulfoxide, a solid was obtained which was identified
as 4-aryl-3-(2'-arylethenesulfonyl)-1H-pyrrole (2) by spectral studies (Scheme 1; Table 1). Compound 2a exhibited two singlets at $\delta 6.85$ and 7.48 ppm , assigned to $\mathrm{C}_{2}-\mathrm{H}$ and $\mathrm{C}_{5}-\mathrm{H}$ of pyrrole ring protons. Two doublets were observed at $\delta 6.96$ and 7.63 ppm corresponding to olefinic protons, in addition to the signals of aromatic protons (Table 3). The ${ }^{13} \mathrm{C}$ nuclear mass spectroscopy (NMR) spectra of $\mathbf{2 a}$ showed signals at $\delta 119.8,125.7$, 125.9 , and 127.3 for pyrrole ring carbons, C-4, C-3, C5 , C-2 and at $\delta 124.2,141.3 \mathrm{ppm}$ for olefinic carbons, $\mathrm{C}-1^{\prime}, \mathrm{C}-2^{\prime}$ (Table 3). Thus the formation of 2 indicates that the reaction was regiospecific. Attempts to prepare bis (4-aryl-1H-pyrrol-3-yl)sulfone (3) by treating $\mathbf{1}$ with

two equivalents of TosMIC were not successful. However, $\mathbf{3}$ was obtained by treating $\mathbf{2}$ with one equivalent of TosMIC, as confirmed by NMR spectroscopy. Compound 3a exhibited two sharp singlets at $\delta 6.84$ and 7.08 ppm corresponding to $\mathrm{C}_{2,2^{\prime}}-\mathrm{H}$ and $\mathrm{C}_{5,5^{\prime}}-\mathrm{H}$. The ${ }^{13} \mathrm{C}$ NMR spectra of 3a exhibited signals at 119.2 (C-4,4'), 122.6 (C-3,3'), 126.2 (C-5,5'), 127.4 (C-2,2'). This indicates that the molecule was highly symmetrical.

The olefin in 2 was utilized in the synthesis of pyrazolines and isoxazolines. When 2 was subjected to 1,3-dipolar cycloaddition reaction with diazomethane, ( $4^{\prime}$-aryl$4^{\prime}, 5^{\prime}$-dihydro- $1^{\prime} H$-pyrazol-3'-yl)-(4-aryl-1H-pyrrol-3-yl)sulfone (4) was obtained (Scheme 1; Table 1). The ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{4 a}$ showed an $A M X$ splitting pattern of
the pyrazoline ring protons at $\delta 4.48\left(H_{A}\right), 3.86\left(H_{M}\right)$ and $3.48 \mathrm{ppm}\left(H_{X}\right)$ respectively, in addition to the signals of the pyrrole ring protons. The observed coupling constant values $J_{\mathrm{AM}}=12.6, J_{\mathrm{AX}}=5.5$ and $J_{\mathrm{MX}}=10.0 \mathrm{~Hz}$ indicated that $H_{A}$ and $H_{M}$ were cis, $H_{A}$ and $H_{X}$ were trans and $H_{M}$ and $H_{X}$ were geminal. The ${ }^{13} \mathrm{C}$ NMR spectrum of $\mathbf{4 a}$ exhibited signals at $\delta 46.9,57.2,119.4,120.3$, $124.8,125.6$ and 152.3 ppm for the carbons $\mathrm{C}-4^{\prime}, \mathrm{C}-5^{\prime}$, $\mathrm{C}-4, \mathrm{C}-3, \mathrm{C}-5, \mathrm{C}-2$, and $\mathrm{C}-3^{\prime}$, respectively (Table 2).

In addition, the reaction of 2 with nitrile imines and nitrile oxides generated from araldehyde phenylhydrazones and araldoximes in the presence of chloramine-T resulted in ( $1^{\prime}, 3^{\prime}, 5^{\prime}$-triaryl-4 $4^{\prime}, 5^{\prime}$-dihydro- $1^{\prime} H$-pyrazol- $4^{\prime}$ -yl)-(4-aryl-1H-pyrrol-3-yl)-sulfones (5) and ( $3^{\prime}, 5^{\prime}$-diaryl-

4',5'-dihydroisoxazol-4'-yl)-(4-aryl-1H-pyrrol-3-yl)-sulfone (6), respectively (Scheme 1; Table 1). The ${ }^{1} \mathrm{H}$ NMR spectrum of 5a and 6a displayed two doublets at $\delta 5.25,5.19$ and $5.63,5.67 \mathrm{ppm}$, respectively, which were assigned to $\mathrm{C}_{4^{\prime}}-\mathrm{H}$ and $\mathrm{C}_{5^{\prime}}-\mathrm{H}$, the two methine protons of the pyrazoline and isoxazoline rings. The $J$ values indicated that they were in trans geometry (Table 3). The ${ }^{13} \mathrm{C}$ NMR spectra of 5a and 6a displayed signals at 63.0, 64.9 (C$4^{\prime}$ ), 87.4, 83.7 (C-5'), 119.2, 119.4 (C-4), 121.0, 121.9 (C$3), 124.4,124.3(\mathrm{C}-5), 126.8,126.3(\mathrm{C}-2)$ and 154.9 , 151.7 (C-3'), respectively (Table 3). Compounds 4a, 5a and $6 \mathbf{a}$ on oxidation with chloranil in xylene, gave the corresponding pyrazoles and isoxazoles 7a, 8a and 9a. The disappearance of two doublets corresponding to pyrazoline/isoxazoline ring protons in the ${ }^{1} \mathrm{H}$ NMR spectra confirmed their formation.

## CONCLUSION

A simple dipolarophile, bis(styryl)sulfone was exploited to get a new and novel sulfone-linked bis(heterocycles) containing two different heterocyclic rings adopting simple and versatile 1,3-dipolar cycloaddition methodology.

## EXPERIMENTAL

Melting points were determined in open capillaries on a Mel-Temp apparatus and are uncorrected. The purity of the compounds was checked by thin layer chromatography (Silica
gel H, BDH, ethyl acetate-hexane, 1:3). The infrared (IR) spectra were recorded on a Thermo Nicolet IR 200 FT-IR in KBr pellets and the wave numbers were given in $\mathrm{cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectra were recorded in $\mathrm{CDCl}_{3} / \mathrm{DMSO}-d_{6}$ on a Jeol JNM $\lambda$-300 MHz. The ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3} / \mathrm{DMSO}-d_{6}$ on a Jeol JNM spectrometer operating at 75.5 MHz. All chemical shifts are reported in $\delta(\mathrm{ppm})$ using TMS as an internal standard. Elemental analyses were performed using Perkin-Elmer 240C elemental analyser. The starting substrates $E, E$-bis(styryl)sulfones were prepared according to the literature procedure [14]. Araldehyde phenylhydrazones and araldoximes were prepared by standard procedures [15].

4-Aryl-3-(2-arylethenesulfonyl)-1H-pyrroles (2). General procedure. A mixture of TosMIC ( 5 mmol ) and 1 (5 mmol ) in $\mathrm{Et}_{2} \mathrm{O} / \mathrm{DMSO}$ (2:1) was added dropwise under stirring to a suspension of $\mathrm{NaH}(50 \mathrm{mg})$ in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at room temperature. Stirring was continued for about 6 h . Then it was diluted with $\mathrm{H}_{2} \mathrm{O}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The ethereal layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo. The resultant solid was purified by recrystallization from MeOH .

Bis(4-aryl-1H-pyrrol-3yl)-sulfones (3). General procedure. A mixture of TosMIC ( 5 mmol ) and $2(5 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O} / \mathrm{DMSO}$ (2:1) was added dropwise under stirring to a suspension of $\mathrm{NaH}(50 \mathrm{mg})$ in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at room temperature. Stirring was continued for about 7 h . Then, $\mathrm{H}_{2} \mathrm{O}$ was added and the product was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo. The resultant solid was purified by column chromatography [Silica gel, hexane-ethyl acetate (1:4)].
(4'-Aryl-4', $\mathbf{5}^{\prime}$-dihydro- $\mathbf{1}^{\prime} \boldsymbol{H}$-pyrazol-3'-yl)-(4-aryl- $1 H$-pyr-rol-3-yl)-sulfones (4). General procedure. To a cooled solution of $2(5 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$, an ethereal solution of diazomethane ( $40 \mathrm{~mL}, 0.4 M$ ) and triethylamine $(0.12 \mathrm{~g}$ ) were added. The reaction mixture was kept at -20 to $-15^{\circ} \mathrm{C}$ for $48-$ 56 h . The solvent was removed under reduced pressure. The resultant solid was purified by recrystallization from MeOH .
( $1^{\prime}, 3^{\prime}, 5^{\prime}$-Triaryl-4', $5^{\prime}$-dihydro- $\mathbf{1}^{\prime}$ H-pyrazol-4'-yl)-(4-aryl-
$1 H$-pyrrol-3-yl)-sulfones (5). General procedure. A mixture of $2(1 \mathrm{mmol})$, araldehyde phenylhydrazone ( 2 mmol ) and chloramine-T ( 2 mmol ) in $\mathrm{MeOH}(20 \mathrm{~mL}$ ) was refluxed for $20-22 \mathrm{~h}$. over a water bath. The precipitated inorganic salts were filtered off. The filtrate was concentrated and the residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic phase was washed with water, brine and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed under reduced pressure. Recrystallization of the crude product from ethanol resulted in pure 5.
( $3^{\prime}, 5^{\prime}$-Diaryl-4', $5^{\prime}$-dihydro-isoxazol-4'-yl)-(4-aryl-1H-pyr-rol-3-yl)-sulfones (6). General procedure. A mixture of 2 $(1 \mathrm{mmol})$, araldoxime ( 2 mmol ) and chloramine- $\mathrm{T}(2 \mathrm{mmol})$ in $\mathrm{MeOH}(20 \mathrm{~mL})$ was refluxed for $16-18 \mathrm{~h}$. over a water bath. The precipitated inorganic salts were filtered off. The filtrate was concentrated and the residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic phase was washed with water, brine and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed under reduced pressure. Recrystallization of the crude product from ethanol resulted in pure 6.
( $4^{\prime}$-Phenyl-1' $\boldsymbol{H}$-pyrazol- $3^{\prime}$-yl)-(4-phenyl-1 $H$-pyrrol-3-yl)sulfone (7a)/(4-phenyl-1H-pyrrol-3-yl)-( $\mathbf{1}^{\prime}, \mathbf{3}^{\prime}, 5^{\prime}$-triphenyl-1 $\mathbf{1}^{\prime} \boldsymbol{H}$ -pyrazol-4'-yl)-sulfone (8a)/(3', $5^{\prime}$-diphenyl-isoxazol-4'-yl)-(4-phenyl-1H-pyrrol-3-yl)-sulfone (9a). General procedure. A solution of $\mathbf{4 a} / 5 \mathbf{a} / \mathbf{6 a}(1 \mathrm{mmol})$ and chloranil $(1.04 \mathrm{mmol})$ in

xylene ( 10 mL ) was refluxed for $30-35 \mathrm{~h}$. Then it was treated with $5 \%$ sodium hydroxide solution. The organic layer was separated and repeatedly washed with water, dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and was removed on a rotary evaporator. The solid obtained was purified by recrystallization in isopropanol to give pure $7 \mathbf{7 a} / \mathbf{8 a} / 9 \mathbf{a}$ respectively.

Acknowledgment. The authors are thankful to DST, New Delhi, India for the financial assistance under major research project.
