Summary

Deuterium-labelled coenzyme Q₁₀ ([2-CD₃-1'-CD₂]coenzyme Q₁₀, coenzyme Q₁₀-d₅) was synthesized by condensation of 2,3-dimethoxy-[5-CD₃]methyl-1,4-hydroquinone with [1-CD₂]decaprenol. Five positions were selected for deuteration as replacement at these positions allowed examination of every step of the synthesis. This examination was carried out by a combination of ¹H- and ¹³C-nuclear magnetic spectrometry and mass spectrometry. Further, these positions have been proved to be metabolically stable. This reagent makes simultaneous quantification of the source of coenzyme Q₁₀ (exogenously supplied or endogenously supplied) possible in biological samples by measurements on gas chromatography–mass spectrometry. Key Words: [2-CD₃-1'-CD₂]coenzyme Q₁₀; [1-CD₂]decaprenol; 2,3-dimethoxy-[5-CD₃]methyl-1,4-hydroquinone; LiAID₄

Introduction

The effects of exogenous coenzyme Q₁₀ (Co Q₁₀) on isoprenoid derivatives, including Co Q₁₀, have long been of great interest.¹ The

differentiation of exogenous and endogenous Co Q₁₀ *in vivo* is a crucial problem in the discussion of the effectiveness of Co Q₁₀ administration. The contribution of exogenous Co Q₁₀ to total Co Q₁₀ levels in tissues warrants investigation. Deuterium-labelled Co Q₁₀ is an excellent tool to resolve this issue. Simultaneous quantification of deuterium-labelled and unlabelled compounds by gas chromatography–mass spectrometry was established.²

Using deuterium-labelled Co Q₁₀ (Co Q₁₀-d₅) **10** the behaviour of exogenous Co Q₁₀ has been reported in three papers.^{3–5} However, the preparation procedure of the compound has not previously been described. The purpose of this paper is to describe a detailed preparation procedure for the synthesis of [2-CD₃-1'-CD₂]Co Q₁₀ **10**. The synthesis of the corresponding radio-labelled compound, [3'-¹⁴C] Co Q₁₀ was described in the previous article.⁶

Materials and methods

Solanesol (natural) was obtained from Nisshin Flour Milling Co. (Tokyo, Japan). Ethyl decaprenoate (all-*trans* isomer: 95%) was prepared followed the procedure described previously.⁶ 3,4,5-Trimethoxybenzoic acid **3** was obtained from Tokyo Kasei Organic Chemicals (Tokyo, Japan). Co Q₁₀ was supplied by Eisai Co., Ltd. Silica gel for chromatography (Wakogel C-200) and deuterium oxide were purchased from Wako Chemical Industries, Osaka, Japan. Silica alumina was purchased from Nikki Chemical Co. (Yokohama, Japan). Lithium aluminium deuteride (LiAlD₄, Art 5664) was purchased from Merck A. G. (Darmstadt, Germany). Thin-layer chromatography (TLC) was performed using Kieselgel GF₂₅₄ (Art 5715, Merck A. G.). Spots were visualized under ultraviolet light in a dark room after applying concentrated sulphuric acid spray followed by heating. All yields given refer to isolated yields obtained after a final purification by column chromatography or recrystallization. Nuclear magnetic resonance (NMR) spectra were measured using CDCl₃ solution with a JEOL-GX200 spectrometer (Japan Electron Optics Laboratory, Tokyo, Japan). Tetramethyl silane was used as an internal standard. The conditions were as follows: ¹H-NMR: 200 MHz. The data are expressed in δ (ppm). The NMR signals are abbreviated as follows: s, singlet; d, doublet; t, triplet; m, multiplet. The number of protons is shown in parentheses. ¹³C-NMR: 200 MHz. The data are expressed in hertz (Hz).

Mass spectra were measured on a JEOL-JMS-D200. Assays for individual determination of Co Q₁₀ and [2-CD₃-1'-CD₂]Co Q₁₀ **10** were performed on a JEOL JMS-D300 gas chromatograph–mass spectrometer unit equipped with a computer system (JEOL, JMA-2000). The ionizing voltage and ionizing current were 70 eV and 300 μA, respectively. The chamber temperature was maintained at 300°C. The sample temperature was raised linearly from 100°C to 430°C within 3 min. During this time, mass fragments from m/z 824 to m/z 900 were scanned and integrated. The peak ratio was plotted against the internal standard.

2,3,5-Trimethyl-6-decapenyl-p-benzoquinone⁷ was used as an internal standard for quantitative analysis of Co Q₁₀.² For individual analysis, a multiple ion detector was adjusted to m/z 869 ($[M+2]^+$) for exogenous Co Q₁₀ ([2-CD₃-1'-CD₂]Co Q₁₀ **10**), m/z 864 ($[M+2]^+$) for endogenous Co Q₁₀ and m/z 832 ($[M+2]^+$) for the internal standard.³

Results and Discussion

The synthesis of [2-CD₃-1'-CD₂]Co Q₁₀ **10** was performed by condensation of deuterated decaprenol **2**, and deuterated Co Q₀, hydroquinone (2,3-dimethoxy-[5-CD₃]methyl-1,4-hydroquinone **9**). The total synthetic process, which includes eight steps, is shown in Chart 1.

Basically, the route employed here for the synthesis of deuterium-labelled Co Q₁₀ was the same as that we established previously for synthesizing radio-labelled Co Q₁₀.⁶ [1-CD₂]Decaprenol **2** was obtained starting from natural solanesol (all-*trans* configuration) via ethyl decaprenoate by the same synthetic route as shown previously.⁶ The deuteration of decaprenol was performed by treating ethyl decaprenoate **1** with LiAlD₄, and then deuterium oxide. The ¹H-NMR of **2** showed no signal at δ 4.24 (allylic methylene protons), even under conditions of 20-fold amplification. A nuclear component 2,3-dimethoxy-[5-CD₃]methyl-1,4-hydroquinone **9** was synthesized starting from 3,4,5-trimethoxybenzoic acid **3** in six steps. 3,4,5-Trimethoxybenzoic acid **3** was esterified with methanol to give methyl-3,4,5-trimethoxybenzoate **4**. Reduction of **4** with LiAlD₄, gave 3,4,5-trimethoxy-[CD₂]benzylalcohol **5**. The alcohol **5** was brominated with PBr₃ and then reduced with LiAlD₄, giving 3,4,5-trimethoxy-[CD₃]toluene **7**. The deuteration ratio of the compound was calculated to be 96.5% based on the residual

D: deuterium

Chart 1. Synthesis of Deuterium - labelled coenzyme Q₁₀

signal intensity at δ 2.3 (ring methyl protons) compared with ring proton intensity at δ 6.30 (2H) on ¹H-NMR spectra. The tri-deutero compound **7** was oxidized by lead dioxide to give 2,3-dimethoxy-[5-CD₃]methyl-1,4-benzoquinone **8**. The deuteration ratio of **8** was calculated to be 96% based on the comparison of the signal intensity at δ 2.08 (ring methyl proton position) with those of ring protons (δ 6.35) on ¹H-NMR spectra. The ¹³C-NMR spectrum of **8** showed no signal at 386 Hz corresponding to the ring methyl signal found in the spectrum of the unlabelled compound. Apart from the differences mentioned above, the labelled and unlabelled compounds were found to give similar signals. Then the benzoquinone **8** was reduced with Na₂S₂O₄ to give 2,3-dimethoxy-[5-CD₃]-methyl-1,4-hydroquinone **9**. The ¹³C-NMR spectrum showed complete disappearance of the signal at 386 Hz, assigned to ring methyl group. Condensation of **9** borate with [1-CD₂]decaprenol **2**, followed by hydrolysis and oxidation with lead dioxide gave a *cis-trans* mixture of [2-CD₃, 1'-CD₂]Co Q₁₀ **10**. The crude product was purified by chromatography on silica gel then recrystallized three times

from cooled acetone. The stable isotope chemical yield of the purified [2-CD₃-1'-CD₂]Co Q₁₀ **10** from [1-CD₂]decaprenol **2** was 22%. The ¹H-NMR spectrum of **10** showed no signal at δ 3.28 (1'-methylene protons), even under conditions of 20-fold amplification. The spectrum was identical to that of the unlabelled Co Q₁₀ except for the absence of peaks corresponding to ring methyl and 1'-methylene protons. On ¹³C-NMR spectrum, no signal was detected at either 292 (ring methyl) or 637 Hz (1'-methylene). Stereospecificity of the final compound **10** was confirmed by performing high-performance liquid chromatography followed by the method described previously.⁸ After recrystallizing the silica gel chromatography-purified product, the *cis*-isomer content was found to be 0.5%. The deuteration ratio and stereospecificity were sufficiently high to enable us to use this deuterium-labelled form of Co Q₁₀ in metabolic studies.

Experiments

[1-CD₂]Decaprenol **2**

Ethyl decaprenoate **1** 25 g (34 mmol) and LiAlD₄, 70 mg (17 mmol) were suspended in 100 ml of absolute ether and 5 ml of deuterium oxide. Reduction was carried out by adding 400 g of silica gel (60–80 mesh). The crude product was purified by chromatography. [1-CD₂]Decaprenol **2** 21.7 g (yield: 92%) was obtained. ¹H-NMR: 5.31 (s, 1 H, =CH), 5.01 (m, 9 H, =CH), 1.9–2.1 (m, 38 H, -CH₂-), 1.62 (s, 3 H, =CCH₃), 1.58 (s, 30 H, -CH₃). ¹³C-NMR: Signal at 1490 Hz, observed for corresponding unlabelled compound, disappeared completely. Mass spectra: *m/z* 701 ([M⁺]), corresponding unlabelled compound: *m/z* 699, *m/z* 682 ([M⁺]-DHO), corresponding unlabelled compound: *m/z* 681 ([M⁺]-H₂O).

Methyl-3,4,5-trimethoxybenzoate **4**

3,4,5-Trimethoxybenzoic acid **3** was esterified quantitatively in methanol in the presence of concentrated sulphuric acid under refluxing for 5 h. The reaction mixture was poured onto iced water to precipitate needle crystals. After filtration, the crystals were recrystallized from methanol. Methyl-3,4,5-trimethoxybenzoate **4** was obtained as crystals.

M.p. 82–84°C. Yield: 92%. R_f value: 0.56 (EtOAc/C₆H₆, 1:9); 0.18 (C₆H₆). IR spectra: 1700 cm⁻¹ (ester).

3,4,5-Trimethoxy-[CD₂]benzylalcohol 5

Methyl-3,4,5-trimethoxybenzoate **4** 60 g (265 mmol) was reduced with 8 g (190 mmol) of LiAlD₄, in 21 of absolute ether under stirring and refluxing for 4 h. Excess LiAlD₄ was decomposed with 20 ml of deuterium oxide. The product was extracted with ether, and then dried. The solvent was removed *in vacuo*. The residue was distilled under reduced pressure. The purified compound 46.1 g was obtained by vacuum distillation at 164–167°C/1 mmHg. Yield: 87%. R_f value: 0.10 (EtOAc/C₆H₆, 1:9); 0.08 (C₆H₆). IR spectra: appearance of OH. ¹H-NMR: 6.32 (s, 2 H, Ar-H), 3.78 (s, 9 H, Ar-OMe). The signal at δ 5.46 (benzyl protons) disappeared. The deuteration ratio could not be determined due to overlap with the base line. Mass spectra: m/z 200 ([M⁺]), m/z 185 ([M⁺]-CH₃), m/z 183 ([M⁺]-OH).

3,4,5-Trimethoxy-[CD₂]benzylbromide 6

3,4,5-Trimethoxy-[CD₂]benzylalcohol **5** 47 g (235 mmol) was dissolved in 1 l of ether and 10 ml of pyridine was added and the temperature was maintained at 0–5°C. To the solution, 20 ml of PBr₃ (350 mmol equivalent) dissolved in ether (total volume 100 ml) was added gradually. The reaction mixture became cloudy. After the completion of addition, stirring continued for further 2 h at the same temperature. After confirmation of the disappearance of the starting material by TLC, the reaction mixture was poured into 1 l of diluted HCl and then extracted twice with 1 l of ether each extraction. The extract was washed with water, and then dried. The solvent was removed *in vacuo*. The crude product 46 g was obtained as a pale yellow oil. Yield: 74%. As the product was unstable, further purification was not attempted and this crude product was directly applied to the next step. R_f value: 0.44 (EtOAc/C₆H₆, 1:9); 0.33 (C₆H₆). IR spectra: disappearance of OH.

3,4,5-Trimethoxy-[CD₃]toluene 7

3,4,5-Trimethoxy-[CD₂]benzylbromide **6** 46 g (175 mmol) was reduced with 3.7 g (88 mmol) of LiAlD₄ in 400 ml of absolute ether under stirring and refluxing for 4 h. Excess LiAlD₄ was decomposed with

10 ml of deuterium oxide. The product was extracted with ether, and then purified by silica gel chromatography. The purified compound **7** 20.4 g was obtained as a pale yellow oil. Yield: 74%. The product could not be differentiated from corresponding unlabelled compound by TLC or IR spectra comparison. R_f value: 0.50 (EtOAc/C₆H₆, 1:9); 0.44 (C₆H₆). ¹H-NMR: 6.30 (s, 2H, Ar-H), 3.80 (s, 9H, Ar-OCH₃). The deuteration ratio, calculated on the basis of the ratio of the residual signal intensity at δ 7.7 proton to the ring proton intensity at δ 3.68 (2H), was 96.5%. ¹³C-NMR: The signal at 546 Hz, observed for the corresponding unlabelled compound, disappeared completely. Mass spectra: m/z 185 ([M⁺]), m/z 170 ([M⁺]-CH₃).

*2,3-Dimethoxy-[5-CD₃]methyl-1,4-benzoquinone **8***

3,4,5-Trimethoxy-[CD₃]toluene **7** 39.3 g (253 mmol) was dissolved in 200 ml of AcOH. To the solution, 10 ml of 10% sulphuric acid was added. At room temperature, 80 ml of 40% peracetic acid was added gradually to the solution. The colourless reaction mixture changed to red and the temperature of the reaction mixture increased to 50–60°C. After completion of the addition of peracetic acid, stirring was continued for further 16 h at 25–30°C. The disappearance of peracetic acid was checked with potassium iodide starch paper. The reaction mixture was poured onto iced water. The product was extracted with ether, washed with a diluted solution of sodium bicarbonate, and then dried. The solvent was evaporated *in vacuo*. The residual solid was purified by silica gel chromatography. The pure product **8** 24.8 g was obtained as reddish needle crystals. Yield: 54%. M.p.: 75–77°C. The product could not be differentiated from corresponding unlabelled compound by TLC, or IR and UV spectra comparisons. R_f value: 0.36 (EtOAc/C₆H₆, 1:9); 0.36 (C₆H₆). ¹H-NMR spectra: 6.35 (s, 1H, Ar-H), 3.90 (s, 6H, Ar-OCH₃). Mass spectra: m/z 185 ([M⁺]), corresponding unlabelled compound: m/z 182, m/z 170 ([M⁺]-CH₃).

*2,3-Dimethoxy-[5-CD₃]methyl-1,4-hydroquinone **9***

2,3-Dimethoxy-[5-CD₃]methyl-1,4-benzoquinone **8** 24.8 g (134 mmol) was reduced by the usual hydroreduction procedure with 50 g of Na₂S₂O₄, 300 ml of ether and 400 ml of water. The resulting mixture was extracted twice, each time with 500 ml of ether and then dried. The solvent was removed *in vacuo*. 2,3-Dimethoxy-[5-CD₃]methyl-1,4-

hydroquinone **9**, 16 g was obtained as colourless sand grain-sized crystals. Yield: 64%. R_f value: 0.21 (EtOAc/C₆H₆, 1:9); 0.18 (C₆H₆); 0.13 (*n*-hexane/CHCl₃, 1:1). A red spot was recognized on spraying Emmerie–Engel reagent. ¹H-NMR: δ 6.45 (s, 1 H, Ar-H), 5.76 (s, 2 H, Ar-OH), 3.84 (s, 3 H, Ar-OCH₃), 3.01 (s, 3 H, Ar-OCH₃). The ¹³C-NMR spectrum showed complete disappearance of the signal at 386 Hz, assigned to ring methyl group. Mass spectra: m/z 187 ([M⁺]), m/z 172 ([M⁺]-CH₃). The product was used immediately in the next reaction.

[2-CD₃-1'-CD₂]Coenzyme Q₁₀ **10**

2,3-Dimethoxy-[5-CD₃]methyl-1,4-hydroquinone borate was prepared by allowing a mixture of 2,3-dimethoxy-[5-CD₃]methyl-1,4-hydroquinone **9** 16 g (86 mmol), 5 g of boric acid and 85 ml of toluene to react under stirring and refluxing until 2.3 ml of dehydrated water was obtained. The toluene was then removed *in vacuo* and 65 ml of *n*-hexane and 30 ml of benzene were added to the residue to substitute the solvent. To the solution, [1-CD₂]decaprenol **2** 19.6 g (28 mmol) and 30 g of silica alumina were added. The condensation reaction was carried out at 40–45°C for 4 h under stirring. After completion of addition, the reaction was allowed to continue for 2 hours at the same temperature. The end of the reaction was judged by the appearance of the Co Q₁₀ spot as examined by TLC. The reaction mixture was then filtered. The filtrate was oxidized by 7 g of lead dioxide, 5 g of charcoal carbon and 5 ml of acetic acid. After the reaction, the reaction mixture was filtered and the filtrate was washed with water, extracted with toluene and then dried. The solvent was removed *in vacuo*. The red oily residue was purified by chromatography using 800 g of silica gel. The chromatography purified product (14.5 g) was found to give a single spot on TLC. Yield: 60%. After recrystallization three times, each time by addition of a 5-fold excess of cooled acetone compared to the crude product (–2°C), [2-CD₃-1'-CD₂]Co Q₁₀ **10** (6.4 g) was obtained. The final product was obtained as a yellow solid. M.p.: 47.8°C. Yield from [1-CD₂]decaprenol **2** was 22%. The *cis*-isomer content of the purified [2-CD₃-1'-CD₂]Co Q₁₀ **10** was 0.5%. The Co Q₉ content of **10** was less than 0.1%. R_f value: 0.44 (*n*-hexane-CHCl₃, 1:1); 0.46 (C₆H₆). ¹H-NMR: 6.78 (s, 3 H, =CCH₃), 5.18 (m, 10 H, =CH), 4.02 (s, 3 H, Ar-OCH₃), 4.00 (s, 3 H, Ar-OCH₃), 1.9–2.1 (m, 38 H, -CH₂-), 1.70 (s, 3 H, =CCH₃), 1.60 (s, 27 H, =CCH₃). Mass spectra: m/z 869

([M + 2]⁺), *m/z* 240 (pyrylium ion), *m/z* 202 (benzylum ion), corresponding unlabelled compound: *m/z* 864, *m/z* 235, *m/z* 197.⁹
