# SYNTHESIS AND CATION-BINDING PROPERTIES OF ( $1 \rightarrow 6$ )-2,5-ANHYDRO-D-GLUCITOL WITH 3,4-DI-O-PENTYL AND DECYL GROUPS BY CYCLOPOLYMERIZATION OF 1,2:5,6-DIANHYDRO-D-MANNITOLS 

TOYOJI KAKUCHI*<br>Division of Bioscience<br>Graduate School of Environmental Earth Science<br>TOSHIFUMI SATOH, $\dagger$ JUNJI MATA, SATOSHI UMEDA, HISAHO HASHIMOTO, $\ddagger$ and KAZUAKI YOKOTA*<br>Division of Molecular Chemistry<br>Graduate School of Engineering<br>Hokkaido University<br>Sapporo 060, Japan

#### Abstract

The cyclopolymerizations of 1,2:5,6-dianhydro-3,4-di-O-pentyl-Dmannitol (1b) and 1,2:5,6-dianhydro-3,4-di-O-decyl-D-mannitol (1c) were carried out using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ and $t$-BuOK. All the resulting polymers consisted of cyclic constitutional units, i.e., the extent of cyclization was $100 \%$. The polymer structures for the polymerization with $t$-BuOK were

[^1]( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-pentyl-D-glucitol (2b) and ( $1 \rightarrow 6$ )-2,5-anhy-dro-3,4-di-O-decyl-D-glucitol (2c), whereas those with $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ comprised 2,5-anhydro-D-glucitols as major units along with other cyclic ones. These polymers were soluble in $n$-hexane, $\mathrm{CHCl}_{3}$, and THF, but insoluble in water, which differs from the amphiphilic solubility of ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-methyl-d-glucitol (2a). The cation-binding properties of $\mathbf{2 b}$ and $2 \mathbf{c}$ were examined using alkali-metal picrates in order to compare them with those of $\mathbf{2 a}$. The extraction yields for each cation decreased in the order of $\mathbf{2 c}<\mathbf{2 b}<\mathbf{2 a}$. Every polymer exhibited a similar cation-binding selectivity in the order $\mathrm{Cs}^{+}>\mathrm{Rb}^{+}>\mathrm{K}^{+}>$ $\mathrm{Na}^{+}>\mathrm{Li}^{+}$. The ratio of $\mathrm{K}^{+}$and $\mathrm{Na}^{+}, \mathrm{K}^{+} / \mathrm{Na}^{+}$, was 4.6 for $2 \mathrm{a}, 5.1$ for $\mathbf{2 b}$, and 7.1 for $\mathbf{2 c}$ in the increasing order $\mathbf{2 a}<\mathbf{2 b}<\mathbf{2 c}$.

## INTRODUCTION

For the cyclopolymerization of 1,2:5,6-dianhydro-3,4-di-O-methyl-D-mannitol (1a), the structure of cyclic repeating units in the resulting polymer depended on the nature of the catalysts used. The polymer using $t$-BuOK was ( $1 \rightarrow 6$ )-bonded 2,5-anhydro-D-glucitol, i.e., ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-methyl-D-glucitol (2a) [1], whereas that consisting of mainly 2,5 -anhydro-D-glucitol as the cyclic constitutional units was obtained using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}[2,3]$. The structural characteristic of $\mathbf{2 a}$ is a lack of the anomeric linkage which is found in the naturally occurring polysaccharides, and hence 2 a is a new type of polycarbohydrate. (See Scheme 1.)

Polymer 2a acted as a host in the host-guest complexation, thereby exhibiting cation-binding selectivity in the order $\mathrm{Cs}^{+}>\mathrm{Rb}^{+}>\mathrm{K}^{+} \gg \mathrm{Na}^{+}>\mathrm{Li}^{+}$and the chiral discrimination property toward racemic amino acids [2, 4, 5]. A part of our research interests is the utilization of $2 a$ as an agent for a specific separation of substrates. The recovery of 2 a , however, was difficult because of its amphiphilic solubility, i.e., 2 a is soluble in $\mathrm{CHCl}_{3}, \mathrm{THF}$, and $\mathrm{CH}_{3} \mathrm{OH}$, and also in $\mathrm{H}_{2} \mathrm{O}$. A similar problem was found with crown ether; for example, the hydrophilic property of 18 -crown- 6 was decreased by introducing a long alkyl chain into the ring [6, 7]. This strategy seems to be useful for improving the solubility property of 2a. There are two synthetic routes for $\mathbf{2 a}$ with alkyl chain groups: 1) the synthesis and cyclopolymerization of 3,4-di-O-alkyl-1,2:5,6-dianhydro-D-mannitol, and 2) the substitu-

1a, 2a: $\mathrm{R}=\mathrm{CH}_{3}$; 1b, 2b: $\mathrm{R}=\mathrm{n}-\mathrm{C}_{5} \mathrm{H}_{11}$; 1c, 2c: $\mathrm{R}=\mathrm{n}-\mathrm{C}_{10} \mathrm{H}_{21}$; 1d, 2d: $\mathrm{R}=\mathrm{H}$
tion of alkyl groups at 3,4-di-O-positions of ( $1 \rightarrow 6$ )-2,5-anhydro-D-glucitol (2d) [8]. The aim of this study is the synthesis of 3,4 -di- $O$-alkyl substituted $(1 \rightarrow 6)-2,5-$ anhydro-D-glucitol by the former method.

In this paper we report the cyclopolymerizations of 1,2:5,6-dianhydro-3,4-di-$O$-pentyl- and 3,4 -di- $O$-decyl-D-mannitol ( $\mathbf{1 b}$ and $1 \mathbf{c}$ ) using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ and $t$ - BuOK . The polymer structures are confirmed by comparing the ${ }^{13} \mathrm{C}$-NMR spectra with that of ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-methyl-D-glucitol (2a). In addition, the binding properties of $\mathbf{2 b}$ and $\mathbf{2 c}$ toward alkali-metal picrates are examined using the liquidliquid extraction method.

## EXPERIMENTAL

## Measurement

${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectra were recorded with a Jeol JNM-EX270 instrument. UV spectra were run with a Jasco 660 UV/VIS spectrophotometer. Optical rotation was determined with a Jasco DIP-140 digital polarimeter. The molecular weights of the resulting polymers were measured by gel permeation chromatography (GPC) in tetrahydrofuran on a Jasco HPLC system equipped with three polystyrene gel columns (Shodex KF-804L). The number-average molecular weight ( $M_{\mathrm{n}}$ ) was calculated on the basis of polystyrene calibration.

## Materials

Boron trifluoride etherate $\left(\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}\right)$ was purified by distillation of a commercial product under reduced pressure. Potassium tert-butoxide ( $t$-BuOK) was purified by sublimation under vacuum before use. All solvents were purified by the usual methods, and dichloromethane, nitroethane, and toluene were distilled over calcium hydride and 1,4-dioxane and THF from sodium benzophenone.

## Monomers

1,2:5,6-Dianhydro-3,4-di-O-pentyl-d-mannitol (1b) was prepared by the procedure of Kuszmann [9], bp $105^{\circ} \mathrm{C} / 0.1$ torr. $[\alpha]_{\mathrm{D}}+9.3^{\circ}\left(c=1.0\right.$ in $\mathrm{CHCl}_{3}$ at $22^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.89\left(t,{ }^{3} J_{\text {vic }}=7.1 \mathrm{~Hz}, 6 \mathrm{H}\right.$, pentyl- $\left.\mathrm{CH}_{3}\right), 1.28-1.36(\mathrm{~b}$, 8 H , pentyl $-\mathrm{CH}_{2}$ ), $1.55-1.61\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{3} \mathrm{H}_{7}\right), 2.79\left(\mathrm{dd}, J_{\mathrm{gem}}=5.3 \mathrm{~Hz}\right.$, ${ }^{3} J_{\text {trans }}=2.6 \mathrm{~Hz}, \mathrm{C} 1$-, C 6 -trans $\left.-\mathrm{CH}_{2}\right), 2.85\left(\mathrm{dd}, J_{\text {gem }}=5.4 \mathrm{~Hz},{ }^{3} J_{\text {cis }}=3.8 \mathrm{~Hz}, \mathrm{Cl}\right.$-, $\mathrm{C} 6-\mathrm{cis}-\mathrm{CH}_{2}$ ), 3.12-3.16 (m, 2H, C2-, C5-CH), 3.26-3.30 (m, $2 \mathrm{H}, \mathrm{C} 3-\mathrm{C} 4-\mathrm{CH}$ ), 3.47-3.66 ( $\mathrm{m}, 4 \mathrm{H},-\mathrm{OCH}_{2}-, \mathrm{C}_{4} \mathrm{H}_{9}, \mathrm{CH}$ ); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 14.00\left(\mathrm{CH}_{3}\right)$, $22.45,28.10,29.59\left(\mathrm{CH}_{2}\right), 46.13(\mathrm{C} 1, \mathrm{C} 6), 50.54(\mathrm{C} 2, \mathrm{C} 5), 72.01\left(\mathrm{OCH}_{2}\right), 79.56$ (C3, C4).

1,2:5,6-Dianhydro-3,4-di-O-decyl-d-mannitol (1c) was synthesized using the procedure similar to that for $\mathbf{1 b}$, as shown in Scheme 2.

## 3,4-Di-O-decyl-1,2:5,6-di-O-isopropyridene-D-mannitol (3)

To a mixture of $36 \mathrm{~g}(0.9 \mathrm{~mol})$ of sodium hydride ( $60 \%$ mineral oil suspension) in 300 mL of dry THF was added a solution of $104.8 \mathrm{~g}(0.4 \mathrm{~mol})$ of 1.2 : $5,6-\mathrm{di}-\mathrm{O}$-isopropyridene-D-mannitol in 300 mL of dry THF. After stirring for 12

## SCHEME 2

hours, a solution of $176.9 \mathrm{~g}(0.8 \mathrm{~mol})$ of 1-bromodecane in 160 mL of dry DMSO was added, and then the mixture was stirred at $50^{\circ} \mathrm{C}$ for 4 hours. The reaction mixture was chilled, diluted with water, and extracted with chloroform. The extract was washed with water, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure. The residue was distilled to give 94 g (yield, $43.4 \%$ ) of 3, bp $170^{\circ} \mathrm{C} / 6 \times 10^{-5}$ torr. $[\alpha]_{\mathrm{D}}+14.4^{\circ}\left(c=1.0\right.$ in $\mathrm{CHCl}_{3}$ at $\left.22^{\circ} \mathrm{C}\right) ; R_{\mathrm{f}} 0.29$ (ethyl acetate $/ n$-hexane, $1 / 10$ ); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.88\left(\mathrm{t},{ }^{3} J_{\text {vic }}=6.8 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 1.27\left(\mathrm{~s}, 28 \mathrm{H}, \mathrm{CH}_{2}\right), 1.38(\mathrm{~s}$, $\left.12 \mathrm{H}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.54-1.57\left(\mathrm{~m}, 4 \mathrm{H},-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right), 3.52\left(\mathrm{~d},{ }^{3} J_{\text {vic }}=6.1 \mathrm{~Hz}\right.$, $2 \mathrm{H}, \mathrm{C} 3-, \mathrm{C} 4-\mathrm{CH}), 3.56-3.62\left(\mathrm{~m}, 4 \mathrm{H},-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right), 3.92\left(\mathrm{dd}, J_{\mathrm{gem}}=8.2 \mathrm{~Hz}\right.$, $\left.{ }^{3} J_{\mathrm{cis}}=6.6 \mathrm{~Hz}, \mathrm{C} 1-, \mathrm{C} 6-\mathrm{cis}-\mathrm{CH}_{2}\right), 4.08\left(\mathrm{dd}, J_{\mathrm{gem}}=8.2 \mathrm{~Hz},{ }^{3} J_{\text {trans }}=6.2 \mathrm{~Hz}, \mathrm{Cl}-\right.$, C6-trans- $\mathrm{CH}_{2}$ ), 4.19 (q, $J=6.25 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C} 2-\mathrm{C} 5-\mathrm{CH}$ ); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 14.11$ $\left(\mathrm{CH}_{3}\right), 22.68,26.08\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right), 25.43,26.72,29.32,29.52,29.59,31.89\left(\mathrm{CH}_{2}\right)$, $30.31\left(-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right), 66.81(\mathrm{C} 1, \mathrm{C} 6), 73.42\left(-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right), 75.81(\mathrm{C} 2$, C5), $80.40(\mathrm{C} 3, \mathrm{C} 4), 108.45\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right)$.

Analysis. Calculated for $\mathrm{C}_{32} \mathrm{H}_{62} \mathrm{O}_{6}$ (542.84): C, 70.80; H, 11.51. Found: C, 70.79; H, 11.69.

## 3,4-Di-O-decyl-D-mannitol (4)

A solution of 23.2 g ( 43 mmol ) of 3 in 116 mL of acetic acid and 58 mL of water was refluxed for 30 minutes. After cooling, the mixture was evaporated under reduced pressure. This procedure was repeated until the odor of acetic acid disappeared. The residue was recrystallized from ethyl acetate to give 13.7 g (yield, $69.5 \%$ ) of $4, \mathrm{mp} 93^{\circ} \mathrm{C} . R_{\mathrm{f}} 0.57$ (methanol/chloroform, $1 / 5$ ); $[\alpha]_{\mathrm{D}}+26.7^{\circ}(\mathrm{c}=$ 1.0 in $\mathrm{CH}_{3} \mathrm{OH}$ at $22^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.90\left(\mathrm{t},{ }^{3} J_{\text {vic }}=6.9 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right)$, 1.25-1.40 (b, 28H, $\mathrm{CH}_{2}$ ), 1.53-1.59 (m, 4H, $-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}$ ), 3.30-3.37 (m, $\left.4 \mathrm{H},-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right), 3.56-3.75\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{C} 1-, \mathrm{C}_{6}-\mathrm{CH}_{2}, \mathrm{C} 2-, \mathrm{C} 3-, \mathrm{C} 4-, \mathrm{C} 5-\mathrm{CH}\right)$, $3.80\left(\mathrm{dd}, 2 \mathrm{H}, J=11.1 \mathrm{~Hz}, J=2.7 \mathrm{~Hz}, \mathrm{C} 1-, \mathrm{C} 6-\mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 14.77$ $\left(\mathrm{CH}_{3}\right), 24.03,27.59,30.77,31.01,32.67\left(\mathrm{CH}_{2}\right), 31.70\left(-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right), 65.00$ $(\mathrm{Cl}, \mathrm{C} 6), 74.20\left(-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right), 72.70(\mathrm{C} 2, \mathrm{C} 5), 80.36(\mathrm{C} 3, \mathrm{C} 4)$.

Analysis. Calculated for $\mathrm{C}_{26} \mathrm{H}_{54} \mathrm{O}_{6}$ (462.71): $\mathrm{C}, 67.49 ; \mathrm{H}, 11.76$. Found: C , 66.90; H, 11.93.

## 3,4-Di-O-decyl-1,6-di-O-p-toluenesulfonyl-D-mannitol (5)

To a solution of $12.7 \mathrm{~g}(27 \mathrm{mmol})$ of 4 in 60 mL of pyridine was added 11.3 g ( 59 mmol ) of $p$-toluenesulfonyl chloride at $0^{\circ} \mathrm{C}$. After stirring at $0^{\circ} \mathrm{C}$ for 0.5 hour and then at room temperature for 0.5 hour, water was added, and the mixture was extracted with chloroform. The extracts were washed with dilute hydrochloric acid, dried under $\mathrm{Na}_{2} \mathrm{SO}_{2}$, and evaporated under reduced pressure. The residue was chromatographed on silica gel with ethyl acetate $/ n$-hexane ( $1 / 7$ ) to give 17.8 g (yield, $80.2 \%$ ) of 5. $R_{\mathrm{f}} 0.30$; $[\alpha]_{\mathrm{D}}+16.3\left(c=1.0\right.$ in $\mathrm{CHCl}_{3}$ at $\left.22^{\circ} \mathrm{C}\right)$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ $\delta 0.89\left(\mathrm{t}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 1.26\left(\mathrm{~s}, 28 \mathrm{H}, \mathrm{CH}_{2}\right), 1.43-1.48\left(\mathrm{~m}, 4 \mathrm{H},-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right)$, $2.45\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{ArCH}_{3}\right), 3.40-3.62\left(\mathrm{~m}, 6 \mathrm{H},-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}, \mathrm{CH}\right), 3.96-4.01(\mathrm{~m}, 2 \mathrm{H}$, CH ), 4.17-4.19 (m, 4H, C1-, C6-CH2), 7.34-7.37 (m, 4H, Ar), 7.79-7.82 (m, 4H, $\mathrm{Ar}) ;{ }^{33} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 14.10\left(\mathrm{CH}_{3}\right)$, $22.66\left(\mathrm{ArCH}_{3}\right), 25.90,29.30,29.56,31.88$ $\left(\mathrm{CH}_{2}\right), 31.70\left(-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right), 69.46,76.60(\mathrm{CH}), 71.11(\mathrm{Cl}, \mathrm{C} 6), 72.95$ $\left(-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right), 128.03,129.90(\mathrm{Ar})$.

Analysis. Calculated for $\mathrm{C}_{40} \mathrm{H}_{66} \mathrm{O}_{10} \mathrm{~S}_{2}$ (771.09): C, 62.31; H, 8.63; S, 8.32. Found: C, 61.46; H, 8.71; S, 8.00.

## 1,2:5,6-Dianhydro-3,4-di-O-decyl-D-mannitol (1c)

A mixture of 18.8 g ( 24 mmol ) of 5 and 3.2 g of ground KOH in 100 mL of ether was vigorously stirred under reflux for 1 hour. After the mixture cooled, the precipitates were removed by filtering the mixture through a pad of Celite, and then the filtrate was evaporated under reduced pressure. The residue was distilled under reduced pressure to give 2.2 g (yield, $22.1 \%$ ) of $\mathbf{1 c}$ as a colorless liquid, $\mathrm{bp} 120^{\circ} \mathrm{C} / 6$ $\times 10^{-5}$ torr. $R_{\mathrm{f}} 0.3$ (ethyl acetate $/ n$-hexane, $1 / 7$ ); $[\alpha]_{\mathrm{D}}+6.8^{\circ}\left(c=1.0\right.$ in $\mathrm{CHCl}_{3}$ at $22^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.88\left(\mathrm{t},{ }^{3} \mathrm{~J}_{\text {vic }}=6.9 \mathrm{~Hz}, 6 \mathrm{H}\right.$, decyl- $\left.\mathrm{CH}_{3}\right), 1.21-1.31$ (b, 28 H , decyl- $\mathrm{CH}_{2}$ ), $1.54-1.62\left(\mathrm{~m}, 4 \mathrm{H},-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right), 2.79\left(\mathrm{dd}, \mathrm{J}_{\mathrm{gem}}=5.4\right.$ $\left.\mathrm{Hz},{ }^{3} J_{\text {trans }}=2.7 \mathrm{~Hz}, \mathrm{C} 6-\mathrm{CH}_{2}\right), 2.85\left(\mathrm{dd}, J_{g \mathrm{~cm}}=5.4 \mathrm{~Hz},{ }^{3} J_{\text {cis }}=3.9 \mathrm{~Hz}, \mathrm{C} 6-\mathrm{CH}_{2}\right)$, 3.13-3.16 (m, 2H, C2, C5-CH2), 3.26-3.28 (m, 2H, C3-, C4-CH), 3.46 (dd, 2 H , $\left.J_{\text {gem }}=9.3 \mathrm{~Hz},{ }^{3} J_{\text {vic }}=6.9 \mathrm{~Hz},-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right), 3.67\left(\mathrm{dd}, 2 \mathrm{H}, J_{\text {gem }}=9.3 \mathrm{~Hz},{ }^{3} J_{\text {vic }}\right.$ $\left.=6.6 \mathrm{~Hz},-\mathrm{OCH}_{2}-\mathrm{C}_{9} \mathrm{H}_{19}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 14.08\left(\mathrm{CH}_{3}\right), 22.64,25.96,29.29$, 29.41, 29.54, 29.57, $31.88\left(\mathrm{CH}_{2}\right), 29.92\left(-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{8} \mathrm{H}_{17}\right), 46.11(\mathrm{C} 1, \mathrm{C} 6)$, $50.54(\mathrm{C} 2, \mathrm{C} 5), 72.03\left(\mathrm{OCH}_{21-\mathrm{C} 9} \mathrm{H}_{19}\right), 79.56(\mathrm{C} 3, \mathrm{C} 4)$.

Analysis. Calculated for $\mathrm{C}_{26} \mathrm{H}_{50} \mathrm{O}_{4}$ (426.69): C, 73.18; H, 11.82. Found: C, 73.01; H, 11.83.

## Polymerization Using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$

A typical polymerization procedure is as follows: Monomer $\mathbf{1 b}$ ( $500 \mathrm{mg}, 1.75$ mmol) was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3.50 \mathrm{~mL})$, and a solution of $\mathrm{BF} \cdot \mathrm{OEt}_{\mathrm{t}}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $24.8 \mu \mathrm{~L}$ in $0.70 \mathrm{~mol} \cdot \mathrm{~L}^{-1}, 0.0175 \mathrm{mmol}$ ) was added using a microsyringe at $0^{\circ} \mathrm{C}$. After 24 hours the reaction mixture was poured into a large amount of methanol containing a drop of aqueous ammonia, and the entire solution was evaporated under reduced pressure. The residue was extracted using $n$-hexane $/ \mathrm{MeOH}$, and the

MeOH layer was evaporated under reduced pressure. This procedure was repeated several times until the monomer in the product obtained from the MeOH phase disappeared in the GPC trace ( $158 \mathrm{mg}, 31.6 \%$ ). The $M_{\mathrm{n}}$ and $M_{\mathrm{w}} / M_{\mathrm{n}}$ were 6200 and 1.98 , respectively. $[\alpha]_{\mathrm{D}}+19.7^{\circ}\left(\mathrm{C}=1.0 \mathrm{in} \mathrm{CHCl}_{3}\right.$ at $\left.22^{\circ} \mathrm{C}\right)$; ${ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta$ $14.02\left(\mathrm{CH}_{3}\right)$, 22.46, $22.50\left(-\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, 28.33, $28.37\left(-\mathrm{OC}_{2} \mathrm{H}_{4}-\mathrm{CH}_{2}-\mathrm{C}_{2} \mathrm{H}_{5}\right)$, 29.48, $29.54\left(-\mathrm{OCH}_{2} \mathrm{CH}_{2}-\mathrm{C}_{3} \mathrm{H}_{2}\right), 69.39(\mathrm{C} 6) 69.77,69.89\left(-\mathrm{OCH}_{2}\right), 71.96(\mathrm{C} 1)$, 79.97 (C5), $82.44(\mathrm{C} 2), 83.26(\mathrm{C} 4)$, and $84.38 \mathrm{ppm}(\mathrm{C} 3)$.

## Polymerization Using t-BuOK

A typical polymerization procedure is as follows: The polymerization was carried out in a H-shaped glass ampule. $t$-BuOK ( $4.2 \mathrm{mg}, 0.035 \mathrm{mmol}$ ) and dry THF $(0.72 \mathrm{~mL})$ were added to one side of the ampule, and $1 \mathrm{c}(309 \mathrm{mg}, 0.72 \mathrm{mmol})$ was added to the other side of the ampule under a nitrogen atmosphere. After sealing under vacuum, the monomer and the catalyst solution were mixed at $60^{\circ} \mathrm{C}$. After 48 hours the reaction mixture was poured into a large amount of methanol containing a drop of 0.1 N hydrochloric acid, and the entire solution was evaporated under reduced pressure. The residue was purified by reprecipitation from $n$-hexane/ MeOH to give the polymer ( $170 \mathrm{mg}, 53.4 \%$ ). The $M_{\mathrm{n}}$ and $M_{\mathrm{w}} / M_{\mathrm{n}}$ were 7600 and 1.25 , respectively. $[\alpha]_{\mathrm{D}}+23.7^{\circ}\left(c=1.0\right.$ in $\mathrm{CHCl}_{3}$ at $\left.22^{\circ} \mathrm{C}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta$ $14.11\left(\mathrm{CH}_{3}\right), 22.68\left(-\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 26.19,26.24\left(\mathrm{CH}_{2}\right), 29.36\left(\mathrm{CH}_{2}\right), 29.54\left(\mathrm{CH}_{2}\right)$, 29.63, $29.66\left(\mathrm{CH}_{2}\right), 29.84\left(\mathrm{CH}_{2}\right), 29.92\left(\mathrm{CH}_{2}\right), 31.91\left(\mathrm{CH}_{2}\right), 69.30(\mathrm{C} 6) 69.80,69.98$ $\left(-\mathrm{OCH}_{2}\right), 72.00(\mathrm{C} 1), 79.92(\mathrm{C} 5), 82.38(\mathrm{C} 2), 83.25(\mathrm{C} 4)$, and $84.45 \mathrm{ppm}(\mathrm{C} 3)$.

## Cation-Binding Property

The extraction of alkali metal picrates was carried out using a procedure similar to the one developed by Pedersen [10]. A solution of polymer in dichloromethane ( $\left[2,5\right.$-anhydro-D-glucitol units in polymer] $=4.5 \times 10^{-4} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$ ) was vigorously shaken in a culture tube with a solution of alkali hydroxide and picric acid in water ([metal hydroxide] $=0.1 \mathrm{~mol} \cdot \mathrm{~L}^{-1}$ and [picric acid] $=7 \times 10^{-5}$ $\mathrm{mol} \cdot \mathrm{L}^{-1}$ ). After separating into two phases, the alkali picrate extracted into dichloromethane was determined by measuring the absorbance of picrate remaining in the aqueous phase at 357 nm on a UV spectrophotometer.

## RESULTS AND DISCUSSION

## Cyclopolymerization of 1,2:5,6-Dianhydro-D-mannitol

Table 1 lists the results of the polymerizations of 1,2:5,6-dianhydro-3,4-di- $O$ -pentyl-D-mannitol (1b) and 1,2:5,6-dianhydro-3,4-di-O-decyl-D-mannitol (1c) using $\mathrm{BF} \cdot{ }_{3} \mathrm{OEt}_{2}$ and $t$-BuOK. All the polymerizations using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ proceeded homogeneously. After 24 hours at $0^{\circ} \mathrm{C}$ the reaction mixture was poured into methanol containing a drop of aqueous ammonia and the solution was evaporated to yield an oil residue consisting of the monomer and polymer. Monomer 1b could not be removed from the mixture by the same solvent, such as $n$-hexane, $\mathrm{CHCl}_{3}, \mathrm{THF}$, and

${ }^{\mathrm{d}} \mathrm{c} 1.0 \mathrm{in} \mathrm{CHCl}_{3}$.

MeOH , as the resulting polymer. The mixture was extracted using $n$-hexane $/ \mathrm{MeOH}$, and the MeOH layer was evaporated under reduced pressure. This procedure was repeated until the absence of the monomer in the product obtained from MeOH phase was confirmed using GPC measurement. For the polymerization in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the yield was $31.6 \%$ and the number-average molecular weight $\left(M_{\mathrm{n}}\right)$ was 6200 , which corresponded to a degree of polymerization (DP) of 21.6. However, the purification of the raw products obtained in $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{3}$ and $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NO}_{2}$ was incomplete because of their lower $M_{\mathrm{n}} \mathrm{s}$. The values of 2700 and 2600 listed in Table 1 were estimated from the GPC traces of the mixtures. On the other hand, the polymers from 1c were soluble in $n$-hexane, $\mathrm{CHCl}_{3}$, and THF but insoluble in MeOH , so they were purified by reprecipitation from $n$-hexane $/ \mathrm{MeOH}$. The polymer yields were $44.5-48.9 \%$ and the $M_{\mathrm{n}}$ was $3900-4600$ ( $\mathrm{DP}=9.1-10.8$ ). The specific rotation $\left([\alpha]_{\mathrm{D}}\right)$ was +25.8 for the polymer from 1 b and +14.4 to +16.0 for those from 1 c ( $c=1.0$ in $\mathrm{CHCl}_{3}$ at $22^{\circ} \mathrm{C}$ ).

For the polymerization using $t$ - BuOK , the catalyst gradually dissolved into the reaction system during a few hours. The solubility properties of the resulting polymers in organic solvents were similar to those using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. The yield and $M_{\mathrm{n}}$ of the polymers were higher than those using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. The highest value of $M_{\mathrm{n}}$ was 7600 ( $\mathrm{DP}=26.5$ ) for the polymer from 1 b in THF and $8400(\mathrm{DP}=19.7$ ) for that from 1 c in $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{3}$. The specific rotations $\left([\alpha]_{\mathrm{D}}\right)$ were +38.9 and +32.8 for the polymers from $\mathbf{1 b}$ and +22.1 and +23.7 for those from $1 \mathbf{c}\left(c=1.0\right.$ in $\mathrm{CHCl}_{3}$ at $22^{\circ} \mathrm{C}$ ).

The polymers synthesized from $\mathbf{1 b}$ and $\mathbf{1 c}$ were soluble in common organic solvents but insoluble in water, which differed from polymer $2 a$ because of its amphiphilic solubility. This means that these polymers are expected to be easily recovered after using complex agents in the host-guest system.

## Polymer Structure

Figure 1 shows the ${ }^{1} \mathrm{H}$-NMR spectra of the polymers obtained from the polymerizations of $\mathbf{1 b}$ and $\mathbf{1 c}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. Because the characteristic absorption at $2.7-3.2 \mathrm{ppm}$ due to the epoxy groups completely disappeared, the polymerization proceeded according to a cyclopolymerization mechanism, leading to polymers consisting of cyclic constitutional repeating units. For the polymers using $t$ - BuOK , the absorption due to the epoxy protons also disappeared in the ${ }^{1} \mathrm{H}$-NMR spectra, i.e., the extent of cyclization was $100 \%$ as well as for the polymers using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$.

The ${ }^{13} \mathrm{C}$-NMR spectra of the polymers from $\mathbf{1 b}$ and $\mathbf{1 c}$ using $\mathrm{BF} \cdot \mathrm{OEt}_{2}$ are shown in Fig. 2. For the polymer from 1b, the signals at 79.97, 82.44, 83.26, and 84.38 ppm were the methine carbons and those at 69.39 and 71.96 ppm were the methylene ones. For the polymer from 1c, those at $79.92,82.38,83.25$, and 85.45 ppm were the methine carbons and those at 69.30 and 72.00 ppm were the methylene ones. Both of the four signals due to the methine carbons are very close to those at $79.83,82.23,84.69$, and 85.43 ppm assigned to the carbons of C5, C2, C4, and C3 for 2 a , respectively [1-3]. This result indicates that the structure of the polymers from both 1 b and 1 c was $1 \rightarrow 6$ bonded 2,5 -anhydro-D-mannitol as the 5 -membered

FIG. 1. ${ }^{13} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ spectra of the polymers $\mathbf{2 b}$ (a) and $\mathbf{2 c}$ (b) obtained with $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$.

FIG. 2. ${ }^{13} \mathrm{C}$-NMR ( $67.5 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) spectra of the polymers 2 b (a) and 2c (b) obtained with $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$.
constitutional unit. However, many small signals were observed, so that the polymer should contain a slight amount of other cyclic repeating units except for 2,5 -anydro-D-mannitol. Their mole fraction could not be determined by ${ }^{13} \mathrm{C}$-NMR spectra. These results were very similar to the polymer structure from 1a [3].

On the other hand, sharp signals were observed in the ${ }^{13} \mathrm{C}$-NMR spectra of the polymers using $t$-BuOK (Fig. 3), which apparently differs from observatons for the polymers using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. This result means that the polymerization using $t$ - BuOK was more highly regio- and stereoselective than that using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. The polymer structures from 1b and 1c using $t$-BuOK were ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-pen-tyl-D-glucitol (2b) and ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-decyl-D-glucitol (2c), respectively.

For the cyclopolymerization of 1 , there was a little difference in the cyclic structural units between the polymers using cationic and anionic catalysts, which can be explained by the general rules for ring closure on the basis of the stereoelectronic effect [11]. In general, the cyclization of 1,2:5,6-diepoxyhexane is supposed

FIG. 3. ${ }^{13} \mathrm{C}$-NMR ( $67.5 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) spectra of the polymers $\mathbf{2 b}$ (a) and $\mathbf{2 c}$ (b) obtained with $t$-BuOK.

${ }^{\mathrm{d}} M_{\mathrm{n}}=8400(\mathrm{DP}=19.7)$.
to form a 5 -membered cyclic product under anionic conditions [12,13], whereas 5 and 6 -membered ones form under cationic conditions. This regioselectivity caused the stereoregularity in the polymer which depended on the catalyst used; nevertheless, the D-mannitol structure in monomer 1 primarily changed to the D-glucitol one in polymer $\mathbf{2}$. Therefore $\mathbf{2}$ should be produced through the regio- and stereospecific cyclopolymerization mechanism. For the intermolecular reaction, the first epoxide cleaved at the $\beta$-bond ( $\mathrm{CH}_{2}-\mathrm{O}$ ), resulting in retention of the $R$ configuration of the $\alpha$-carbon. On the other hand, the intramolecular cyclization proceeded through cleavage at the $\alpha$-bond ( $\mathrm{CH}-\mathrm{O}$ ) of the second epoxide to form a 5 -membered ring, and the configuration of the $\alpha$-carbon was inverted from the $R$ to the $S[1,3,5,14]$.

For 1,2:5,6-dianhydro-d-mannitol (1), the 3,4-di-O-alkyl substituted monomer were regio- and stereoselectively cyclopolymerized to yield ( $1 \rightarrow 6$ )-3,4-di-O-alkyl-2,5-anhydro-D-glucitol (2) except for the monomer with a 3,4 -di- $O$-isopropylidene group [14].

## Cation-Binding Property

The cation-binding properties of ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-pentyl-Dglucitol (2b) and ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-methyl-d-glucitol (2a). For this purpose the specimens used were the polymers with similar degrees of polymerization (DP); 2 a with $M_{\mathrm{n}}=3000(\mathrm{DP}=17.2), \mathbf{2 b}$ with $M_{\mathrm{n}}=6700(\mathrm{DP}=23.4)$, and 2 c with $M_{\mathrm{n}}=8400(\mathrm{DP}=19.7)$. Table 2 lists the results of a one-extraction experiment using picrates of $\mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{K}^{+}, \mathrm{Rb}^{+}$, and $\mathrm{Cs}^{+}$. The extraction yields for each cation decreased in the order $\mathbf{2 a}>\mathbf{2 b}>\mathbf{2 c}$. Every polymer was similar in cation-binding selectivities in the order $\mathrm{Cs}^{+}>\mathrm{Rb}^{+}>\mathrm{K}^{+}>\mathrm{Na}^{+}>\mathrm{Li}^{+}$. However, there is a small difference in the selectivity between $\mathrm{K}^{+}$and $\mathrm{Na}^{+}$. The ratio of $\mathrm{K}^{+}$and $\mathrm{Na}^{+}, \mathrm{K}^{+} / \mathrm{Na}^{+}$, was 4.6 for $2 \mathrm{a}, 5.1$ for 2 b , and 7.1 for 2 c , resulting in an increase in the order $\mathbf{2 a}<\mathbf{2 b}<\mathbf{2 c}$. This indicates that the $\mathbf{3 , 4} \mathbf{- d i}-\mathrm{O}$-alkyl groups of ( $1 \rightarrow 6$ )-2,5-anhydro-D-glucitol (2) slightly affect the cation-binding property, and the oxygens at the 3,4-position act as donor atoms in the host-guest complexation.

## CONCLUSIONS

The cyclopolymerizations of 3,4-di-O-pentyl- and 3,4-di-O-decyl-1,2:5,6-dianhydro-D-mannitol were carried out using BF3. $\mathrm{OEt}_{2}$ and $t$-BuOK. The polymers obtained using $t$-BuOK, ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di- $O$-pentyl-D-glucitol (2b) and $(1 \rightarrow 6)$ - 2,5 -anhydro-3,4-di-O-decyl-D-glucitol (2c), were more highly regio- and stereoselective than those using $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. Therefore, this highly selective cyclopolymerization of $1,2: 5,6$-dianhydrohexitol by using an anionic cataylst is a new method for producing an artificial polycarbohydrate which differs from the ringopening polymerization of the anhydro sugar. Polymers $\mathbf{2 b}$ and $\mathbf{2 c}$ were soluble in $n$-hexane, $\mathrm{CHCl}_{3}$, and THF but insoluble in water, which differs from the amphiphilic solubility of ( $1 \rightarrow 6$ )-2,5-anhydro-3,4-di-O-methyl-d-glucitol (2a). For the binding ability toward alkali-metal picrates, the extraction yields for each cation decreased in the order $\mathbf{2 c}<\mathbf{2 b}<\mathbf{2 a}$. Every polymer exhibited similar cationbinding selectivities in the order $\mathrm{Cs}^{+}>\mathrm{Rb}^{+}>\mathrm{K}^{+} \Rightarrow \mathrm{Na}^{+}>\mathrm{Li}^{+}$, though there was a small difference in the selectivity between $\mathrm{K}^{+}$and $\mathrm{Na}^{+}$.
