in water (slow oxidation, product isolated as the trimer ethanolate) or in methanol (rapid oxidation). In the latter case, nitrogen was substituted for carbon dioxide without affecting the course of the reaction. The crystalline methanolated trimer of hydroxymethylglyoxal was obtained by flash evaporation at 30° of the final supernatant liquid. As reported in the literature, it was an amorphous material without definite melting point, but softened at 150°. It was used in the condensation with aminoguanidine without further purification.

Condensation of Hydroxymethyglyoxal with Aminoguanidine. -- A solution of 21 g. (67 mmoles) of hydroxymethylglyoxal trimer ethanolate (or equivalent methanolate) in 50 ml. of water was depolymerized by warming at 60° for 10 min. A slurry of 47 g. (346 numbers) of aminoguanidine bicarbonate in 150 ml. of 99% ethanol was treated with concentrated hydrochloric acid (about 33 ml.) dropwise with stirring until evolution of carbon dioxide ceased. This slurry was cooled in an ice bath and the solution of hydroxymethylglyoxal was added dropwise over 20 min. After standing at 0° for 1 hr., the reaction mixture was poured slowly, with agitation, into 1600 ml. of cold acetone. The white precipitate was collected by filtration, washed with acetone and ether, and dried in vacuo at room temperature, m.p. 186-188° dec., yield, 17.7 g. After standing overnight in the refrigerator. a second crop of 1.5 g., m.p. 191-193° dec., was obtained from the combined filtrate and washings, total yield, 37.5%. Recrystallization from 99% ethanol raised the m.p. to 197-198° dec.;  $\log \epsilon$  in pH 4 acetate buffer, 4.60 at  $\lambda_{max}$  285 m $\mu$ . Paper chronatography, descending, on Whatman No. 1 paper:  $R_f$  0.39 in 1-propanol-N HCl-H<sub>2</sub>O (3:1:1);  $R_4$  0.41 in 70% ethanol saturated with animonium hicarbonate (run in the dark).

Anal. Calcd. for  $C_0H_{12}N_8O\text{-}2HCl$ : C, 21.99; H, 5.17; N, 41.02. Found: C, 21.79; H, 5.37; N, 40.99.

Nuclear Magnetic Resonance Spectroscopy.—This was run in deuterium oxide, using dioxane ( $\tau$  6.30) as an internal standard. The spectrum of our product showed singlets at  $\tau$  5.43 (water),  $\tau$  5.28 (methylene protons), and  $\tau$  2.36 (vinyl proton), and the three peaks are in the ratio of 12:2:1. On the other hand, methylglyoxal bisguanyllydrazone showed singlets at  $\tau$  7.90 (methyl protons),  $\tau$  5.35 (water), and  $\tau$  2.32 (vinyl proton), and the methyl and vinyl peaks are in a 3:1 ratio.

Antitumor Screening.—This compound was tested for anti-(moor activity in three mouse tumors: advanced leukemia L1210, leukemia P1534 (ascites), and a plasma cell tumor YPC-1 (ascites).<sup>8</sup> Methylglyoxal bisguanylhydrazone was used as a reference compound on account of its known activity in L1210.<sup>8a</sup> Both drugs were injected subcutaneously daily. The inability of hydroxymethylglyoxal bisguanylhydrazone to increase survival time of mice bearing these tumors is readily seen in Table I. This again is in contrast to the reported activity of the compound claimed to be hydroxymethylglyoxal bisguanylhydrazone.<sup>3b</sup>

Table I

Median Survival Time of Mice" at Optimal Treatment

Tumor	Treatment	Optimal dose, mg./kg.	Median survival, days
L1210 <sup>6</sup>	None		7
	${f HOMeGAG'}$	60	7.5
	${f MeGAG}^{f}$	65	15.5
P1534°	None		10.5
	${f HOMeGAG}$	60	10.5
	${f MeGAG}$	60	13
YPC-1 <sup>d</sup>	None		10
	${f HOMeGAG}$	45	11.5
	$\mathbf{MeGAG}$	45	14.5

<sup>a</sup> Ten animals in each group. <sup>6</sup> Treatment, day 5 until death, <sup>e</sup> Treatment, day 1 through day 10. <sup>d</sup> Treatment, day 1 mitil death, <sup>e</sup> Hydroxymethylglyoxal bisguanylhydrazone. <sup>≠</sup> Methylglyoxal bisguanylhydrazone.

## 4-(1-Carboxyethyl)-1,4-oxathianium Bromide

CARL TABB BAHNER AND GORDON SENTER!

Department of Chemistry, Carson-Newman College, Jefferson City, Tempessee

Received July 30, 1983

In the preparation of sulfonium salts the advantage of reaction at or near room temperature was noted.<sup>2</sup> This method has been extended to the reaction of  $\alpha$ -bromopropionic acid (I) with thioxane (II) by allowing a long reaction period. A mixture of 15.3 g. (0.10 mole) of I and 10.0 g. (0.10 mole) of II was kept for 98 months at room temperature (approximately 29°). The unreacted liquid was decanted from the solid product, and the latter was washed with ethanol, then with acetone; yield 10.8 g. (43%) of off-white crystals, m.p. 116–119°.

Anal. Caled. for  $C_7H_{13}BrSO_3$ : C, 32.66; H, 5.10. Found: C, 32.80; H, 5.07.

Screening data provided by the Cancer Chemotherapy National Service indicated that it was ineffective against Sarcoma 180, Leukemia L-1210, and solid Friend Virus Leukemia at a dose level of 175 mg./kg. by daily i.p. injection and that the ED<sub>50</sub> against KB cells in tissue culture was more than 100 μg./ml.

## Some Esters of *dl-exo-*3-Dimethylaminoisoborneol

EDGAR A. STECK<sup>1</sup> AND STEPHEN T. ROSS

Johnson and Johnson Research Center, New Brunswick, New Jersey

Received April 25, 1963

Basic esters, and salts thereof, have frequently exhibited practical levels of pharmacological activity. Our interest lay in determining whether building a 2-dimethylaminoethanol unit into the terpenoid skeleton might lead to useful products (cf. ref. 2, 3). By way of accessibility, exo-3-dimethylaminoisoborneol (I) was chosen as the basic alcohol and converted to the acetate and diphenylacetate. Acid addition salts and methobromides of the esters were tested in vitro for antispasmodic activity. In direct comparison, none of the compounds showed more than 5% the activity of atropine on the guinea pig ileum stimulated with acetylcholine. Similarly, less than 10% of the activity of papaverine was found for all products in countering barium chloride spasms of the isolated ileum.

<sup>(8)</sup> The plasma cell tumor YPC-1 used in this study arose spontaneously in a CAF<sub>1</sub> moose; see S. T. Yancey, J. Natl. Cancer Inst., in press.
