product (5.6 g., 62%) was obtained by recrystallization from CCl₂; infrared (Nujol): NH at 3350, C=O at 1735 m and 1653 s, SO₂ at 1343 and 1170 cm.⁻¹

.1nal. Caled. for $C_{18}H_{18}N_2O_8S$: C, 49.68; H, 5.73; N, 8.92; S, 10.19. Found: C, 49.75; H, 5.71; N, 8.86; S, 10.24.

1-Acetyl-1-allyloxy-3-(p-tolylsulfonyl)urea was prepared simi-

karly, m.p. 155.5–156.5°, in 29% yield. Anal. Caled. for $C_{21}H_{22}N_2S_2O_5$: C. 56.50; H, 4.93; N, 6.28; S, 14.35. Found: C, 56.00; H, 4.97; N, 6.43; S, 14.81.

This product decomposed to give p-toluenesulforamide upon chromatography on alumina.

2-Benzyloxy-4-(p-tolylsulfonyl)allophonate.--A solution of 3.2 g. (0.016 mole) of N-carbethoxy-()-benzyloxylydroxylamine) of and 3.2 g. (0.016 mole) of *p*-toluenesulfonyl isocyanate in dry benzene was refluxed for 3 hr. The solvent was removed and 3.8 g. $(60^{c_1^{\omega}})$, m.p. 97.5-99°, was obtained by recrystallization from ČĊL.

Anal. Caled. for C₁₈H₂₀N₂O₆S: C, 55.10; H, 5.10; N, 7.14; S, 8.16. Found: C, 55.06; H, 5.14; N, 7.26; S, 8.25.

p-Toluenesulfonyl Isocyanate with N-Benzoyl-O-benzyl-vdroxylamine. Formation of Complexes. 1,3-Bis(p-tolylhydroxylamine. sulfonyl)urea with N-(Benzyloxy)benzamide (II) and N-(Benzyloxy)benzamide with p-Toluenesulfonamide (III).--A solution of 4.9 g. (0.025 mole) of *p*-toluenesulfonyl isocyanate and 2.8 g. (0.0123 nole) of N-benzoyl-O-benzylhydroxylamine in 25 ml. of benzene was refluxed for 2 hr. The solvent was evaporated, and the residue was recrystallized from acetone-petroleum ether and a product (II) (5.0 g., 67%) was isolated, m.p. 129-130°

Anal. Calcd. for $C_{29}H_{29}N_3O_5S_2$: C, 58.59; H, 4.71; N, 7.07; S, 10.77. Found: C, 58.71; H, 4.79; N, 7.08; S, 10.73.

From the mother liquor (acetone-petroleum ether) was obtained 1.8 g. (33%) of a second solid (III), m.p. 92–94°. The infrared spectrum of III in chloroform showed NH at 3420, 3400, 3355, and 3230-3275 (broad) and CO at 1675 cm.⁻¹. The n.m.r. spectrum of III in CDCl₃ showed CH₃ & 2.40, CH₂ 5.02, ArH 7.21-7.87, 5 peaks 14H.

Anal. Caled. for $C_{23}H_{22}N_2O_4S$: C, 53.32; H, 5.53; N, 7.04; O, 16.08. Found: C, 53.27; H, 5.50; N, 7.04; O, 16.28.

II was readily converted to III, ethyl *p*-toluenesulfonyl-carbamate, *p*-toluenesulfonamide, and N-benzoyl-O-benzylhydroxylamine when recrystallization from ethanol was attempted. III was readily decomposed to p-toluenesulfonamide and N-benzoyl-O-benzylhydroxylamine by boiling with water, and III could be formed by refluxing equimolar quantities of ptoluenesulfonamide and N-benzoyl-O-benzylhydroxylamine in ethanol.

Monothiophenyl Malonate

JOHN C. HOWARD, MICHAEL C. LIN, PATRICIA MATTHEWS, AND SAM A. SINGAL

Biochemistry Department, Medical College of Georgia, Angusta, Georgia

Received June 23, 1965

Monothiophenyl malonate is a useful intermediate in the synthesis of malonyl coenzyme A, but although two methods of its preparation have been reported^{1,2} the product has in each case been an oil. By a modification of the method of Trans and Brady¹ we have isolated the product as an analytically pure crystalline solid.

Experimental Section³

To a mixture of 4.17 g. (40 number) of malonic acid and 30 ml. of dimethylformannide was added at 0-5°, 2.2 g. (20 mmoles)

of benzepethiol all at once; a dark blue solution resulted. solution of 9.1 g. (44 mmoles) of dicyclohexylcarbodiimide in 50 ml, of dimethylformamide was placed in an addition formel and added dropwise to the magnetically stored solution at 0.5". Addition was completed in 30-45 min. The mixture was then stirred for 2-3 br. at 0-5°. During the addition and subsequent stirring the color changed from blue to yellow. The mixture was added to 600 ml. of ice water, stirred for several minutes, and collected on a sintered-glass formel. The vellow solid, which consisted mainly of dicyclobexylnrea, was washed with 150 mL of ice water and 200 ml, of ether. The two phases of the filtrate were separated and the aqueous phase was extracted with 200 ml. of ether. The ethereal extracts were combined and washed with 100 mL of 0.01 M HCl and 200 mL of ice water. This solution was thea dried (MgSO₅, Darco) for 0.5 hr. The solvert was removed by a rotary evaporator at room temperature and mduced pressure. The residual golden brows oil was dissolved in 10 ml. of tolnepe and diluted with 40 ml. of perrolemp eiber (b.p. 30-60°). The nearly colorless crystals which separated were collected and recrystallized from the same solvent. The yield was 0.5-0.7 g. (13–18 C_t), m.p. 72–73°, ultraviolet absorption $\epsilon_{237}^{CH_3CN}$ 4200. A 10% CHCl_a solution in a 0.1-nm. NaCl cell absorbed strongly in the infrared at 1740 cm.

Anal. Caled. for C₈H₈O₈S: C, 55.09; H, 4.11; S, (6.34). Found: C, 55.07; H, 4.09; S, 16.44.

(4) Benzenethiol frequently causes severe dermativis. Radder gloves should be worn and all operations should be conducted in an efficient bood.

The Reaction of Chloramine with Mercaptopyridine and **Mercaptopyrimidine Derivatives**

THOMAS J. HURLEY AND MARTIN A. ROBINSON

Olin Mathieson Research Center, New Haven, Connecticut

Received July 12, 1965

The reaction of chloramine with heterocyclic mercaptans has, in every instance that was investigated, resulted exclusively in the sulfenamido derivative. The resulting compounds are of considerable interest because of the known biological and agricultural application of the closely related animopyridine analogs^{1,2} and the extremely potent germicidal action of 2-mercaptopyridine N-oxide.³

Experimental Section

All the melting points were taken in capillary tubes and were corrected (ASTM specification thermometers). The molecular weights were obtained by use of a Mecrolab Osmometer, Model 302. Sucrose and benzil were employed as standards.

2-Sulfenamidopyridine,---An aqueous solution of chloramine was prepared by the slow addition of 90 ml. of iced 1.84 M NaOCI solution to 278 ml. of 1.84 M NH₃ solution previously cooled to -5°. To the resulting chloramine solution, an aqueous solution of the sodium salt of 2-mercaptopyridine was added slowly taking care that the temperature did not exceed 5°. The sodium salt was prepared by dissolving 16.5 g. (0.15 mole) of 2-mercaptopyridine in 75 ml. of 2 M NaOH solution. The product precipitated immediately on addition of the sodium salt to the chloramine solution. The crude product was filtered, dried under vacuum to remove excess water, and recrystallized from a petroleum ether-isopropyl alcohol mixture. This resulted in 10.5 g. (55% yield) of a white crystalline product, m.p. 79-80°.

The other compounds were made with appropriate modifications of the general method described above. The results are listed in Table I.
