hr and hydrolyzed with 2.3 ml of water, 2.3 ml of a 15% solution of NaOH, and 7 ml of water. The precipitate formed was filtered and thoroughly washed with ether. After drying and evaporation of the ether, the anine was obtained as an oily residue. The hydrochloride, formed with an alcoholic solution of HCl, was recrystallized from absolute ethanol yielding 1.95 g (50%), mp 188-189°

Anal. Calcd for C₁₅H₁₈ClNO: C, 68.31; H, 6.88; N, 5.31. Found: C, 68.08; H, 6.88; N, 5.11.

2-(5-Hydroxy-2-biphenylyl)ethylamine (8).—The hydrochloride (2.2 g) of 7 was refluxed with 33 ml of 48% HBr for 5 hr. After concentration under vacuum, the red oily residue was dissolved in a small amount of water and treated with a saturated solution of NaHCO₃. Continuous extraction with ether gave a solid material which was converted into the hydrochloride with an ethereal solution of HCl. After recrystallization from absolute ethanol-anhydrous ether, the hydrochloride presented mp 209° dec, yield 1.55 g (74%)

Anal. Calcd for C₁₄H₁₆ClNO: C, 67.34; H, 6.46; Cl, 14.20; N. 5.60. Found: C, 67.22; H, 6.30; Cl, 14.50; N, 5.40.

Ethyl 5-Methoxy-2-biphenylacetate.—Acid 1 (11.4 g) was transformed into the chloride by reaction with 10 g of oxalyl chloride in 30 ml of benzene. After the usual treatment, the acid chloride was dissolved in 30 ml of anhydrous benzene, and the solution was added dropwise with stirring in a cooled ethereal solution of excess diazomethane. The mixture was left overnight at room temperature and the solvents were evaporated under vacuum. The diazo ketone thus obtained, a yellow solid of mp 72-75°, was dissolved in 150 ml of absolute ethanol, the solution was heated at 55-60°, and an alcoholic suspension of Ag₂O (prepared from 2.5 g of AgNO₃ and 2 N NaOH) was added in portions. The mixture was then refluxed for 15 min, treated with charcoal, and filtered, and the solvent was evaporated. Distillation of the residue yielded 7.8 g of the ester (58% yield, based on the acid), bp 184° (2 mm)

Anal. Calcd for C₁₇H₁₈O₃: C, 75.53; H, 6.71. Found: C, 75.39; H, 6.60.

Saponification of the ester with alcoholic NaOH afforded the corresponding acid. mp 114° (lit. 10 mp 115-116°).

2-(5-Methoxy-2-biphenylyl)ethanol.—The above ester (12.7 g) was reduced in 150 ml of anhydrous ether with 4.8 g of LiAlH₄. After decomposition of the complex with water and 3% H₂SO₄, the organic phase was separated, the solvent was evaporated and the residue was distilled under reduced pressure yielding 8.95 g (84%) of the alcohol, bp 160° (1 mm).

Anal. Calcd for C₁₅H₁₆O₂: C, 78.92; H, 7.02. Found: C,

2-(5-Methoxy-2-biphenylyl)ethyl Bromide.—A solution of 1.4 ml of PBr₃ in 6 ml of benzene was added dropwise in a cooled solution of 8.9 g of 2-(5-methoxy-2-biphenylyl)ethanol in 8 ml of anhydrous benzene. The mixture was kept in an ice bath for 3 hr, then warmed at 60° for 3 hr, cooled, and poured into crushed ice. The organic layer was separated, washed successively with 10% NaOH, 10% HCl, and water, and dried, and the solvent was evaporated. The residue yielded on distillation 7 g (61%) of the bromide, bp 166° (1 mm).

Anal. Calcd for C15H15BrO: C, 61.86; H. 5.20; Br. 27.44. Found: C, 62.06; H, 5.09; Br, 27.10.

The method used to prepare the amines 9-12 (see Table I) is illustrated by the following procedure.

 N_1N_2 -Diethyl-2-(5-methoxy-2-biphenylyl)ethylamine (9).— 2-(5-Methoxy-2-biphenylyl)ethyl bromide (3 g) in 20 ml of absolute ethanol was refluxed with 3.7 g of diethylamine for 4 hr. The ethanol was distilled, and the residue was taken up with saturated NaHCO3 and extracted with ether. After washing, drying, and evaporating the ether, the yellow oil was converted into the hydrochloride with alcoholic HCl. The salt was recrystallized from absolute ethanol-anhydrous ether; yield 1.3 g of white needles (see Table I).

Acknowledgments.—The authors gratefully acknowledge support of this investigation by a research grant from the Scientific Committee of NATO. The authors are indebted to Professor P. Lechat, of the Pharmacology Institute of the University of Paris, for carrying out the pharmacological tests, and to the Microanalytical Laboratory of CIBA, Basel (Switzerland), for performing the microanalyses.

Analogs of 2,6-Pyridinedimethanol Bis(N-methylcarbamate)

Received January 27, 1967

Recently, Shimamoto and co-workers have described tbe pharmacology of a new bradykinin antagonist, 2.6-pyridinedimethanol bis(N-methylcarbamate) ($R_1 =$ $R_2 = CH_3NHCO_2CH_2$ in the general structure of Table I), which exhibited powerful antiatherosclerotic properties when fed orally to rabbits. 1,2 Further studies 3,4 have led to the claim that the compound has beneficial effects on human vascular occlusive diseases associated with atherosclerosis, and that it is useful in the treatment of inflammatory disorders such as rheumatic fever and rheumatoid arthritis.

It should be noted that 2,6-pyridinedimethanol bis(N-methylcarbamate) and related compounds show structural resemblances to a series of substitutedpropanol carbamates with antiinflammatory properties. Other pyridinemethanol carbamates have been tested for sedative and anticonvulsive activities.

We have now prepared additional carbamate and urea analogs of 2,6-pyridinedimethanol bis(N-methylcarbamate) and these are listed in Tables I-VI. All the compounds were prepared by standard procedures.

Pharmacology.—All the compounds were found to be inactive when tested orally in rats for possible antiinflammatory activity, using the carrageenin-induced edema technique.8 Representative compounds of the various structural types were also tested for an inhibitory effect on the reversed passive cutaneous anaphylactic reaction in guinea pigs,9 with only compounds 29, 50, and 123 showing activity.

Experimental Section 10

Unless indicated otherwise, the alcohols, thiols, amines, isocyanates, isothiocyanates, and carbamoyl chlorides used to prepare the carbamates and ureas in Tables I-VI were obtained from commercial sources.

Acyl Isocyanates. -- Acetyl isocyanate was prepared from acetyl chloride and silver cyanate. 11 Chloroacetyl isocyanate, butyryl

"A = acetone, B = diethyl ether, C = ethyl acetate, D = ethanol, E = benzene, F = acetonitrile, G = methanol, H = water, I = dimethylformamide, J = Skellysolve B (bp 60–80°), K = 2-propanol, L = 95% ethanol, M = tolnene, N = cyclohexane, O = 1-bittanol. ^b See Experimental Section. ^c C_5H_4N = pyridyl. ^d X = p-tolnenesulfonic acid, $C_7H_8O_9S$; Y = fumaric acid, $0.5C_4H_4O_4$. ^e C_3H_5 = cyclopropyl. ^f $C_4H_3N_2$ = pyrimidinyl. ^g $C_4H_3N_2$ = pyrazinyl. ^h Product obtained from a reaction between 2,6-pyridine-dimethanol in pyridine and insufficient methyl isocyanate for dicarbamate formation. ^f Product obtained by treatment of 19 with the appropriate isocyanate, carbamoyl chloride, or acid azide. ^f C_6H_{11} = cyclohexyl. ^k Sulfur analysis. ^f E. Profft and R. Schmuck, Arch. Pharm., 296. 209 (1963). ^m K. Winterfeld and E. Müller, *ibid.*, 284, 269 (1951). ⁿ Methyl p-tolnenesulfonate of 61. ^o Non-crystalline product. ^p Methiodide of 73.

isocyanate, ¹² bp 109-114° (760 mm), benzoyl isocyanate, and phenylacetyl isocyanate were prepared from the reaction of oxalyl chloride with the corresponding primary amides. ¹³

Acid Azides.—Nicotinic acid azide, pyrimidine-5-carboxylic acid azide (mp 48-53°, characterized as the carbamates 17 and 24), pyrazine-2-carboxylic acid azide¹⁴ (characterized as the carbamates 18 and 25), and cyclopropanecarboxylic acid azide

(not isolated, but characterized as the carbamates 12 and 49) were prepared by the general procedure of Weinstock. 15

Sulfonyl Isocyanates.—Methanesulfonyl isocyanate, ¹⁶ bp 83–84° (16 mm), and benzenesulfonyl isocyanate, ¹⁷ bp 110° (3.7 mm), were both prepared from the reaction of oxalyl chloride with methanesulfonamide and benzenesulfonamide, respectively, by methods similar to those described by Franz and Osuch. ¹⁸

6-Methyl-2-pyridinemethanethiol. bp 49° (0.5 mm), was prepared from 2-chloromethyl-6-methylpyridine in a yield of 44.7%

⁽¹²⁾ This product has not been reported previously but was too reactive toward atmospheric moisture for satisfactory elemental analyses. The product was characterized as the carbamates 29 and 34 and the urea 87.

⁽¹³⁾ A. J. Speziale and L. R. Smith, J. Org. Chem., 28, 1805 (1963).

⁽¹⁴⁾ The crude pyrazine-2-carboxylic acid azide was a semisolid material which could not be purified for satisfactory elemental analyses.

⁽¹⁵⁾ J. Weinstock, J. Org. Chem., 26, 3511 (1961).

⁽¹⁶⁾ O. C. Billeter, Ber., 38, 2013 (1905).

by the general procedure of Urquhart, dt al. The thiol was characterized as the carbamates 44-47.

2.6-Pyridinedimethanethiol, bp 94-96° (0.35 mm), was prepared in 65.3% yield from 2,6-pyridinedimethanol by the general method of Frank and Smith.20 The dithiol was characterized as the carbamates 48-53.

2-[2-(6-Methylpyridyl)]ethanol(2) 2-[2-(6-methylpyridyl)]-1.3-propanediol.²¹ and 1-(2-pyridyl)-3.3.3-trichloro-2-propanol²² were prepared according to known procedures.

2.6-Bis(aminomethyl)pyridine,²³ hp 89-91° (0.15-0.2 mm),

was prepared from 2,6-his (chloromethyl)pyridine24 in 56% yield by the Gabriel method. 25

6-Methyl-2-pyridinemethanol N-oxide. mp 111-113°, was prepared from 6-methyl-2-pyridinemethanol by the method of Furnkawa ²⁶

2-Nitro-1.3-benzenedimethanol.—1,3-Dimethoxycarbonyl-2-nitrobenzene²⁷ was reduced with NaBH₄ and AlCl₃ in diethyleneglycol dimethyl ether by a general method for the reduction of esters to alcohols in the presence of nitro groups.²⁸ The light-sensitive 2-nitro-1,3-benzenedimethanol was recrystallized from water to give yellow needles, mp 101.5–102° (32.5% yield).

Anal. Calcd for C₈H₉NO₄: C, 52.46; H, 4.95; N, 7.65. Found: C, 52.30; H, 5.05; N, 7.74.

3-Methylbenzyl alcohol²⁹ and 1.3-benzenedimethanol³⁰ were prepared by the reductions of methyl m-toluate and dimethyl isophthalate, respectively, with LiAlH₄ in tetrahydrofuran solutions

 $1.3\text{-Benzenedimethanethiol}^{31}$ was prepared from 1,3-benzene-dimethanol according to the general procedure of Frank and Smith. 20

2.5-Thiophenedimethanol. bp 123–125° (0.05 mm), was prepared from thiophene by the method of Griffing and Salisbury. 32

General Methods for the Preparation of Carbamates and Ureas. Method 1.—A solution of an alcohol, thiol, or amine in an appropriate solvent such as pyridine, benzene, tolnene, acetone, or ether was treated with an isocyanate, acyl isocyanate, sulfouyl isocyanate, isothiocyanate, or carbamoyl chloride at temperature ranging from room temperature to the reflux temperature of the solution for 0.5–108 hr. Reactions using the more volatile isocyanates, such as methyl isocyanate, were conducted in glass pressure bottles.

Method 2.—A solution of an alcohol and potassium t-butoxide in t-butyl alcohol was treated with an isothiocyanate at room temperature. ³³

Method 3.—A solution of an alcohol in benzene or pyridine was heated under reflux with an acid azide.

(24) W. Baker, K. M. Buggle, J. F. W. McOmie, and D. A. M. Watkins, J. Chem. Soc., 3594 (1958). Method 4.—Primary carbamates were prepared from the reaction of an alcohol with sodium cyanate and trifluoroacetic acid in methylene chloride.²⁴

Method 5.—A monosubstituted urea was prepared by heating an aqueous solution of an amine hydrochloride and KCNO on a steam bath for 45 minutes.²⁵

Method 6.—A solution of an amine in a solvent such as benzene or ether was treated with an alkyl or aryl chloroformate in the presence of a base such as pyridine or triethylamine.

Acknowledgment.—The authors are particularly grateful to Dr. Max E. Bierwagen and his staff for all of the pharmacological test results and for helpful comments during the preparation of this manuscript. Thanks are also due to Mr. J. C. Heffernan for technical assistance and to the analytical and spectroscopic departments for their services.

2-Acylimino-1,1-dimethylphenethylamines and Related Compounds. Anorectic Agents

JOHN KRAPCHO AND JOHN P. HIGH

The Squibb Institute for Medical Research, New Brunswick, New Jersey

Received December 8, 1966

Numerous substituted phenethylamines exhibit central nervous system stimulation and anorectic activity. We found that 1-(2-imino-1,1-dimethyl-2-phenylethyl)-piperidine (I), when administered to mice by the oral route caused significant CNS stimulation and depres-
