

**imidoethane Iodide (7).** To 7.3 g (1.98 mmoles) of **5** in 150 ml of abs EtOH was added gradually MeI (3.76 g, 26.5 mmoles) and the mixt was refluxed for 1 hr. On standing, 7 pptd; some more 7 pptd on addn of dry Et<sub>2</sub>O. The light-sensitive salt was filtered, washed (Et<sub>2</sub>O), and dried at 0°, yield 9.2 g (91.1%), mp 186–187°. *Anal.* (C<sub>22</sub>H<sub>27</sub>IN<sub>2</sub>O<sub>4</sub>) C, H, N; *m/e* 368 (M<sup>+</sup> – CH<sub>3</sub>I).

The homologous salt (**8**) prepd from **6** was obt'd in 99% yield, mp 152–153°. *Anal.* (C<sub>23</sub>H<sub>29</sub>IN<sub>2</sub>O<sub>4</sub>) C, H, N.

**Hydrazinolysis of Methiodides 7 and 8.** To a suspension of **8** or **7** (2.4–2.55 g, 4.5–5 mmoles) in 25 ml of 95% EtOH was added 0.7–0.75 g (ca. 14.5 mmoles) of 64% hydrazine hydrate. The mixt turned pale yellow and the solid went into soln on heating. After 2 hr of reflux and cooling overnight, a white ppt had formed. HCl (37%) was added dropwise to Congo Red, and the yellowish ppt was filtered off and washed with EtOH and then H<sub>2</sub>O, and the filtrate was evapd. Recrystn of the pale yellow residue from EtOH and from hexane gave 1.28 g (61.5%) of 3-methoxy-4-trimethylammoniumethoxyphenethylamine·HCl·I<sup>-</sup> (**9**), mp 181–182° dec [*Anal.* (C<sub>14</sub>H<sub>26</sub>ClIN<sub>2</sub>O<sub>2</sub>) C, H], and 1-(3-methoxy-4-trimethylammoniumethoxyphenyl)-2-aminopropane·HCl·I<sup>-</sup> (**10**) (1.4 g, 71%), mp 177–179° dec [*Anal.* (C<sub>15</sub>H<sub>28</sub>ClIN<sub>2</sub>O<sub>2</sub>) C, H, N], respectively.

**Hydrazinolysis of 5 and 6.** To an iced aqueous soln of salts **5** (or **6**) (0.01 mole) was added NaOH (0.01 mole) and the liberated amine was extd with Et<sub>2</sub>O (3 × 50 ml). The solvent was evapd, and the residue dissolved in 25 ml of EtOH and a 10% excess of 64% hydrazine hydrate. The warm mixt was refluxed for 45 min, then 6 N HCl (2 ml) was added dropwise. Phthalhydrazide was filtered off and washed (EtOH, H<sub>2</sub>O), the filtrate was concd, and a white ppt was filtered off. The yellow residue from the evapd filtrate was recrystd from abs EtOH: 4-dimethylaminoethoxy-3-methoxyphenethylamine·2HCl (**11**), mp 198–200° dec, yield 36% [*Anal.* (C<sub>13</sub>H<sub>24</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>·H<sub>2</sub>O) C, H, N]; 1-(4-dimethylaminoethoxy-3-methoxyphenyl)-2-aminopropane·2HCl (**12**), mp 209–211°, yield 54% [*Anal.* (C<sub>14</sub>H<sub>26</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>) C, H, N; *m/e* 252 (M<sup>+</sup>)].

## 1,4-Disubstituted Piperazines. 3. Piperazinybenzothiazoles<sup>†</sup>

Matthew Verderame

Chemistry Department, Albany College of Pharmacy, Union University, Albany, New York 12208. Received December 13, 1971

In the course of synthesis of 1,4-disubstituted piperazines,<sup>1</sup> 4-(2-benzothiazolyl)-*N,N*-diethyl-1-piperazinecarboxamide (**2**) was prepared and appeared to exhibit activity against coccidiosis in chickens. Since 2-(1-piperaziny)benzothiazole was new to the literature, the synthesis and biological studies of this parent and its derivatives I, reported in this paper, were undertaken. Retesting of **2**, however, failed to sustain coccidiostatic activity; nor was this activity shown by any of the type I compounds. Of interest, though, was the antifungal action and CNS effects shown by some of these piperazinybenzothiazoles.

**Biological Data.**<sup>‡</sup> Compds **1**, **5**, and **6** were marginal psychomotor stimulants in mice at 300 mg/kg po. Compd **1** also showed antihypertensive activity in rats (approx ED<sub>50</sub> = 6 mg/kg sc). Compds **8** and **14** produced decreased locomotor activity in mice at 16 mg/kg po, and 64 mg/kg po,

respectively. Mice were hyperactive at 256 mg/kg po with **20**, **21**, **22**, and **23**. They showed ataxia at 256 mg/kg po with **24**. In spot tests against *Trichophyton mentagrophytes*, *Aspergillus niger*, and *Candida albicans*, **21**, **22**, **23**, and **24** were active. Compd **9** showed marginal *in vitro* activity against *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Proteus vulgaris*, but was inactive against staphylococcal infections in mice. Many of these compounds were also tested for possible anthelmintic, amebi-

asis, antimalarial, schistosomiasis, antiviral, and antiinflammatory activities.

## Experimental Section<sup>§</sup>

All microanalyses were performed at the Sterling-Winthrop Research Institute. The chemicals were either purchased from Eastman, K and K, or Aldrich, including 1-methylpiperazine and 2-(1-piperaziny)ethanol. The following monosubstituted piperazines were prep'd by literature methods: 1-(*N,N*-diethylcarbomoyl)piperazine,<sup>2</sup> 1-formylpiperazine,<sup>3</sup> 1-diphenylmethylpiperazine,<sup>4</sup> 1-(2-*N,N*-dimethylaminoethyl)piperazine,<sup>5</sup> 1-benzylpiperazine,<sup>6</sup> and 1-*p*-chlorophenylpiperazine.<sup>7</sup>

Also prep'd as intermediates were: 2-bromo-4-chlorobenzothiazole,<sup>8</sup> 2-chloro-6-methoxybenzothiazole,<sup>9</sup> 2-chloro-6-nitrobenzothiazole,<sup>10</sup> and 1-chloroacetyl-3-methylurea.<sup>11</sup> 2-Chloro-6-ethoxybenzothiazole was prep'd according to the procedure used in making 2-chloro-6-methoxybenzothiazole, but was not analyzed: mp 63–67° from hexane.

**1,4-Disubstituted Piperazines (Table I). Procedure A.** One equiv of the alkyl halide was slowly added to a vigorously agitated mixt of 2 equiv of piperazine in 80% alcohol plus excess NaHCO<sub>3</sub> heated at reflux. After filtration, the solvent was removed under reduced pressure. Addn of concd HCl resulted in pptn of the corresponding salt for **1**. For **15**, in addn to many other compds here described, dil HCl dissolved the residue, which was then washed with Et<sub>2</sub>O or EtOAc and repp'd by addn of NaOH. The products were recrystd from the solvents shown in Table I.

**Procedure B.** Two equiv of the appropriate monosubstituted piperazine was used to 1 equiv of the alkyl halide in PhH.

**Procedure C.** A 10% molar excess of the appropriate alkyl halide plus 2-(1-piperaziny)benzothiazole·HCl in an excess of NaHCO<sub>3</sub> and EtOH–H<sub>2</sub>O represented the reaction mixt.

**Procedure D.** Two equiv of the appropriate monosubstituted piperazine to 1 equiv of the alkyl halide in EtOH was used.

**Procedure E.** A 10% molar excess of the alkyl halide to the appropriate monosubstituted piperazine in excess NaHCO<sub>3</sub> plus EtOH–H<sub>2</sub>O was used.

**Procedure F.** Here the mixt consisted of an EtOH soln of a 20% excess of the corresponding C=O compd plus 2-(4-amino-1-piperaziny)benzothiazole.<sup>#</sup>

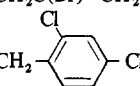

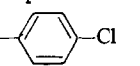

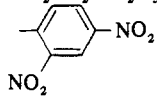

<sup>§</sup>Where analyses are indicated only by symbols of the elements or functions, analytical results obtained were within ±0.4% of the theoretical values.

<sup>#</sup>This compd was prep'd impure from **9** according to Conroy's<sup>12</sup> method of reduction of 1-(*p*-chlorophenyl)-4-nitrosopiperazine; mp 78–85° from petr ether (90–120°), followed by washing with ether.

<sup>†</sup>The author wishes to acknowledge with gratitude the support of this work by the Sterling-Winthrop Research Institute, Rensselaer, N. Y.

<sup>‡</sup>The author wishes to extend his thanks to the Biological Division of Sterling-Winthrop Research Institute for conducting these studies.

### Synthesis of 1,2,4-Triazoles as Potential Hypoglycemic Agents

Benjamin Blank,\* Diana M. Nichols, and Pratul D. Vaidya

Research and Development Division, Smith Kline & French Laboratories, Philadelphia, Pennsylvania 19101.

Received November 23, 1971

Impetus for a study of triazoles was provided by a report that certain 4-alkyl-5-aryl-4*H*-1,2,4-triazole-3-thiols produced hypoglycemia in normal and alloxan-diabetic rats. The potency of these compounds was comparable to that of *N*<sup>1</sup>-(*p*-tolylsulfonamido)-*N*<sup>3</sup>-(*n*-butyl)urea (tolbutamide) while their duration of action was greater.<sup>1,2</sup> Consequently,
