## Adriamycin Analogues. 2. Synthesis of 13-Deoxyanthracyclines<sup>1</sup>

Thomas H. Smith,\* Allan N. Fujiwara, and David W. Henry

Bio-Organic Chemistry Department, SRI International, Menlo Park, California 94025. Received September 26, 1977

The syntheses of several 13-deoxyanthracyclines are described. Koenigs-Knorr condensation of  $\epsilon$ -rhodomycinone (12) with the protected daunosaminyl chloride 15 afforded 14 after deprotection. Efforts to decarbomethoxylate 12, as well as attempts to selectively deoxygenate the 13 position of daunomycinone and adriamycinone, were unsuccessful as approaches to 13-deoxyanthracyclines. However, reaction of the readily available tosylhydrazones 4 and 5, of daunorubicin and adriamycin with NaCNBH<sub>3</sub> in acidic MeOH, afforded the 13-deoxy analogues 6 and 7 in satisfactory yield. These compounds retained antitumor activity, being comparable to the parent compounds in both efficacy and potency in the P-388 mouse leukemia screen. The  $\epsilon$ -rhodomycinone glycoside 14 was less active than 6 and 7.

The anthracycline antibiotics, daunorubicin<sup>2</sup> (1),

- 1, R = Me; R' = O; X = H  
 2, R = Me; R' = O; X = OH  
 3, R = X = H; R' = O  
 4, R = Me; R' = NNHTS; X = H  
 5, R = Me; R' = NNHTS; X = OH  
 6, R = Me; R' = H<sub>2</sub>; X = H  
 7, R = Me; R' = H<sub>2</sub>; X = OH  
 8, R = Me; R' = NNHCOPh; X = H

adriamycin<sup>3</sup> (2), and carminomycin<sup>4</sup> (3), show significant antineoplastic activity against a variety of experimental tumors with daunorubicin and especially adriamycin having clinical utility against human cancer. However, chemotherapy employing these agents is hampered by a number of undesirable side effects, the most serious being dose-related cardiotoxicity.<sup>5</sup> As part of our efforts to prepare related compounds having improved therapeutic properties, we now report the results of our studies of a number of synthetic approaches to 13-deoxyanthracyclines.

The antitumor agents 1-3 differ from the majority of the naturally occurring anthracyclines by the presence of the carbonyl function of C-13,<sup>6</sup> which is one of the principal sites of *in vivo* metabolism of 1 and 2.<sup>7</sup> Lacking the carbonyl function at C-13, the 13-deoxy analogues might possibly display biological properties markedly different from the parent compounds and, in fact, the 13-deoxyanthracyclines, cinerubin A (9)<sup>8</sup> and aclacinomycins A and B (10 and 11),<sup>9</sup> have already demonstrated several interesting biological properties. Besides possessing potent antitumor activity, aclacinomycin A is reported to be substantially less cardiotoxic than adriamycin as determined by ECG monitoring of hamsters,<sup>9</sup> while cinerubin was found to possess low but reproducible activity against an adriamycin-resistant subline of P-388 leukemia.<sup>10</sup>

**Chemistry.**  $\epsilon$ -Rhodomycinone (12),<sup>11</sup> a fermentation by-product, was received as a gift from Bristol Laboratories. We hoped that this aglycon would afford a facile and economic route to 13-deoxyanthracyclines. The Koenigs-Knorr condensation of 12 with four 1 molar equiv portions of 1-chloro-3-*N*-trifluoroacetyl-4-*O*-*p*-nitrobenzoyldaunosamine (15)<sup>12</sup> afforded stereospecifically the  $\alpha$ -glycoside 13. The crude product was treated with aqueous NaOH in THF at 0 °C to effect removal of the sugar-protecting groups. The glycoside 14 could be separated from the now water-soluble sugar by-products of the coupling reaction by solvent extraction and was isolated as the HCl salt in 70% yield from 12.

Attempts to use the aglycon 12 as a starting material for the synthesis of novel aglycons have been unsuccessful. As

would be expected of an axial carbomethoxy group flanked by two ortho substituents,<sup>13</sup> the methyl ester function of 12 was quite resistant to base hydrolysis. Efforts to directly decarbomethoxylate 12 under a variety of conditions were also unsuccessful, and this approach was abandoned.

An obvious route to 13-deoxyanthracyclines is the reductive deoxygenation of the 13-carbonyl of daunorubicin, adriamycin, or their aglycons. While the chemical literature describes several methods for the deoxygenation of the keto function, this approach is complicated by the presence of other easily reducible functionalities, such as the oxygen function at C-7 and the quinizarin nucleus of the aglycon. These problems were apparent in our unsuccessful attempts to deoxygenate daunomycinone 16 via

- 16, R = O  
 17, R = -SCH<sub>2</sub>CH<sub>2</sub>S-  
 18, R = NNHTs  
 19, R = H<sub>2</sub>

a modified Clemmensen procedure<sup>14</sup> or desulfurization of the dithioketal 17.

The deoxygenation of carbonyl compounds via reduction of their tosylhydrazones with NaCNBH<sub>3</sub> has been shown to be an efficient and general procedure.<sup>15</sup> Daunomycinone (16) was converted to the tosylhydrazone 18 in 85% yield. Reaction of 18 with 5 molar equiv of NaCNBH<sub>3</sub> in 1:1 sulfolane-DMF containing 1% *p*-toluenesulfonic acid at 100 °C afforded 13-deoxydaunomycinone (19) in 18% yield.

The poor yield of 19 appeared to rule out this procedure as a practical route to 13-deoxyanthracyclines especially since the coupling of the aglycon with the sugar moiety was still required. However, the possibility of performing the deoxygenation directly on the glycosides appeared attractive. The 13-tosylhydrazones, 4 and 5, of the parent antibiotics were prepared in 94 and 95% yields, respectively. Reaction of 4 with excess NaCNBH<sub>3</sub> in refluxing MeOH containing 1% *p*-toluenesulfonic acid afforded 13-deoxydaunorubicin (6) in 29% yield after silica gel chromatography. A partially identified mixture of non-polar aglycon and 7-deoxyaglycon type materials was also formed. The 13-deoxygenated glycoside 6 was readily characterized by its <sup>1</sup>H NMR spectrum in which the 14-methyl group, which appeared as a singlet at  $\delta$  1.85 in 4, was now a triplet at  $\delta$  0.93 coupled to the new methylene group. The reaction of 5 under identical conditions afforded 13-deoxyadriamycin (7) in 33% yield. The structures of 6 and 7 were also confirmed by the absence of sulfonyl and 13-carbonyl absorption in their IR spectra.

## Results and Discussion

Table I presents a comparison of the test data from the parent compounds and the anthracycline derivatives prepared in this study. The 13-deoxy derivatives 14, 6, and 7 showed similar effects on the stabilization of helical DNA to thermal denaturation as determined by their  $\Delta T_m$  values. However, these values are less than those of 1 and 2, indicating a somewhat decreased ability to bind to DNA. The  $\Delta T_m$  values for the tosylhydrazones 4 and 5 were lower, possibly due to inhibition of intercalation by the steric bulk of the hydrazone function.

All of the derivatives inhibited nucleic acid synthesis in cultured L1210 cells, with the 13-deoxy derivatives 6 and 7 being nearly as potent as the parent compounds. Again

the tosylhydrazones 4 and 5, while displaying significant inhibition, were much less active than the other compounds.

The anthracyclines were assayed *in vivo* against transplanted P-388 lymphocytic leukemia in the mouse. The presence of the 10-carbomethoxy function of 14 seems to be deleterious as 14 is both less active and less potent than 6. The tosylhydrazones 4 and 5, despite their rather mediocre *in vitro* activities, did show high *in vivo* activity, albeit at higher doses than the parent compounds. This is possibly due to hydrolysis of the hydrazone moiety under physiological conditions to regenerate the parent compounds. A precedent for this is the hydrolysis of the benzoylhydrazone function of rubidazole (8) and its analogues which has been observed under approximate physiological conditions.<sup>16</sup> The other 13-deoxy analogues 6 and 7 retained high activity at low doses.

The results of this study indicate that the 13-carbonyl function is not intrinsically required for the biological activity of 1 and 2. Analogues 6 and 7 are comparable both in terms of efficacy and potency to the parent compounds, but further evaluation is required to determine if 6 and 7 offer any advantage.

## Experimental Section

Solvent extracts of aqueous solutions were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. Solutions were concentrated under reduced pressure using a rotary evaporator. All melting points are uncorrected. Infrared spectra (Nujol, Beckman IR-4 instrument) were obtained by the Pharmaceutical Analyses Department of SRI under the direction of Dr. Peter Lim. Measurements of 100-MHz NMR spectra were performed by Mr. L. Cary using a Varian XL-100 spectrometer with Me<sub>4</sub>Si as an internal standard. Elemental microanalyses were provided by the microanalytical laboratory of Stanford University.

Thin-layer chromatograms (TLC) were obtained on silica gel GF 250- $\mu$  plates (Analtech). Preparative layer chromatograms (PLC) were obtained on 20  $\times$  20  $\times$  0.2 cm silica gel 60 F-254 plates (E. Merck). Column chromatography was performed with Bio-Sil A 200-305 mesh (Bio-Rad) or E. Merck prepacked silica gel 60 columns.

(7S,9R,10R)-7-[(3'-Amino-2',3',6'-trideoxy- $\alpha$ -L-lyxohexopyranosyl)oxy]-10-carbomethoxy-9-ethyl-7,8,9,10-tetrahydro-4,6,9,11-tetrahydroxy-5,12-naphthacenedione Hydrochloride (14).  $\epsilon$ -Rhodomycinone (12, 1.07 g, 2.50 mmol), Hg(CN)<sub>2</sub> (5.0 g), HgBr<sub>2</sub> (2.4 g), and powdered molecular sieve 3A (12.0 g) were placed in THF (250 mL) and stirred at 50-55 °C for 1 h. Four 2.50-mmol portions of freshly prepared 1-chloro-3-*N*-trifluoroacetyl-4-*O*-*p*-nitrobenzoyl-daunosamine (15) in CH<sub>2</sub>Cl<sub>2</sub> (25 mL) were added to the reaction mixture at 0, 3, 20, and 25.5 h, while stirring was continued at 50-55 °C. The chloro sugar was prepared by bubbling anhydrous HCl into a cold (0 °C) suspension of 1,4-di-*O*-*p*-nitrobenzoyl-3-*N*-trifluoroacetyl-daunosamine (1.35 g, 2.50 mmol) for 5 min. The mixture was allowed to stand at 0 °C for 10 min and filtered to remove the *p*-nitrobenzoic acid. The filtrate was evaporated, redissolved in CH<sub>2</sub>Cl<sub>2</sub> (25 mL), and added to the reaction mixture. Additional Hg(CN)<sub>2</sub> (5.2 g), HgBr<sub>2</sub> (2.4 g), and powdered molecular sieve 3A (12.0 g) were added to the reaction mixture at 20 h. Stirring at 50-55 °C was continued for 2.5 h after the last addition, for a total reaction time of 28 h. The reaction mixture was allowed to cool to 23 °C and filtered, and the precipitate washed with CH<sub>2</sub>Cl<sub>2</sub> (50 mL). The combined filtrate was evaporated. The residue was triturated with CHCl<sub>3</sub> (250 mL) and filtered, and the filtrate was washed with 30% KI (3  $\times$  160 mL), saturated NaHCO<sub>3</sub> (150 mL), and H<sub>2</sub>O (800 mL), dried, and evaporated.

The residue was stirred for 5 h at 0 °C in 0.1 N NaOH-THF (1:1, 1.3 L), neutralized with 0.1 N HCl (600 mL), and extracted with CHCl<sub>3</sub> (3  $\times$  400 mL). The extracts were combined, washed with saturated NaHCO<sub>3</sub> (2  $\times$  200 mL) and water (3  $\times$  200 mL), dried, and evaporated.

The residue was dissolved in CHCl<sub>3</sub>-ether (1:1, 100 mL) and cooled to 0 °C. Ethereal HCl (5.80 mL of a 0.40 M anhydrous solution, 2.33 mmol) was added at 0 °C with vigorous stirring.

<sup>a</sup>  $\Delta T_m$  and ED<sub>50</sub> values were determined by the method described in ref 1b except that the drugs were initially dissolved in a volume of Me<sub>2</sub>SO that resulted in a final Me<sub>2</sub>SO concentration of 5 and 1%, respectively, in the assay medium. This modification greatly aided solubilization and did not affect assay results according to extensive control experiments.

<sup>b</sup> Assays arranged through the Drug Research and Development Program, Division of Cancer Treatment, National Cancer Institute. BDF or CDF mice are injected ip with 10<sup>6</sup> P-388 lymphocytic leukemia cells on day 0 and are treated ip on days 1-9 or days 5, 9, 13 with the specified drug dose. For detailed protocols, see R. I. Geran, N. H. Greenberg, M. M. MacDonald, A. M. Schumacher, and B. J. Abbott, *Cancer Chemother. Rep., Part 3*, 3 (2), 9 (1972). <sup>c</sup> Ratio of average survival times of treated mice to untreated controls in percent. The average survival time of untreated controls is approximately 11 days. Activity is defined as values of T/C  $\geq$  125.

Additional ether (350 mL) was added and the mixture was kept at 0 °C for 3.5 h. The precipitate was collected, washed with ether, and dried to afford 1.08 g (72%) of 14: IR 2.95 (OH), 5.00 (-NH<sub>3</sub><sup>+</sup>), 5.78 (C=O), 6.50  $\mu\text{m}$  (quinone); UV-visible  $\lambda_{\text{max}}$  (MeOH) 235 nm ( $\epsilon$  33910), 254 (20806), 296 (5493), 492 (15224), 510 (11582), 527 (10000); NMR (Me<sub>2</sub>SO-*d*<sub>6</sub>)  $\delta$  1.18 (m, 6, 14-H<sub>3</sub> and 6'-H<sub>3</sub>), 1.3-2.3 (m, 6, 13-H<sub>2</sub> and 2'-H<sub>2</sub>), 3.70 (s, 3, CO<sub>2</sub>Me), 4.16 (s, 1, 10-H), 4.98 (br s, 1, 7-H), 5.37 (br s, 1, 1'-H), 7.35 (d, 1, 3-H), 7.73 (m, 2, 1-H and 2-H); TLC (4:1 CHCl<sub>3</sub>-MeOH) *R*<sub>f</sub> 0.40. Anal. (C<sub>28</sub>H<sub>31</sub>N-O<sub>11</sub>·HCl·H<sub>2</sub>O) C, H, N.

**Daunomycinone 13-Ethylenedithioketal (17).** Daunomycinone (16, 21.0 mg, 0.050 mmol) and ethanedithiol (40  $\mu\text{L}$ ) were placed in CHCl<sub>3</sub> (5 mL). HCl(g) was slowly bubbled into the solution for 1 h and the solution was stirred at 23 °C for 2 h. The solvent was removed, and the residue was triturated with CHCl<sub>3</sub> (20 mL) and filtered. The filtrate was evaporated, and the residue was chromatographed (PLC, 95:5 CHCl<sub>3</sub>-MeOH) to afford 18.2 mg (77%) of 17: mp 234-237 °C; IR 2.85 (OH), 6.16, 6.30  $\mu\text{m}$  (H-bonded quinone); NMR (CDCl<sub>3</sub>)  $\delta$  2.02 (s, 3, 14-H<sub>3</sub>), 2.21 (m, 2, 3-H<sub>2</sub>), 3.02 (m, 2, 10-H<sub>2</sub>), 3.39 (s, 4, SCH<sub>2</sub>CH<sub>2</sub>S), 4.09 (s, 3, OMe), 5.31 (m, 1, 7-H), 7.34 (dd, 1, *J* = 8 Hz and *J* = 1 Hz, 3-H), 7.74 (t, 1, *J* = 8 Hz, 2-H), 8.01 (dd, 1, *J* = 8 Hz and *J* = 1 Hz, 1-H), 13.34 (s, 1, phenolic OH), 13.96 (s, 1, phenolic OH); TLC (95:5 CHCl<sub>3</sub>-MeOH) *R*<sub>f</sub> 0.48. Anal. (C<sub>23</sub>H<sub>22</sub>O<sub>7</sub>S<sub>2</sub>) C, H.

**Daunomycinone 13-Tosylhydrazone (18).** Daunomycinone (16, 15 mg, 0.038 mmol), *p*-toluenesulfonylhydrazide (9 mg, 0.048 mmol), and *p*-toluenesulfonic acid (3.0 mg) were placed in THF (5 mL) and refluxed for 2.5 h. The solvent was removed, and the residue was triturated with hot MeOH (6 mL), cooled, and filtered to afford 18.3 mg (85%) of 18: mp 201-205 °C; IR 2.90 (OH, NH),

6.15, 6.30 (H-bonded quinone), 8.62  $\mu\text{m}$  (SO<sub>2</sub>); TLC (95:5 CHCl<sub>3</sub>-MeOH) *R*<sub>f</sub> 0.28. Anal. (C<sub>28</sub>H<sub>26</sub>N<sub>2</sub>O<sub>9</sub>S·0.25H<sub>2</sub>O) C, H, N.

**13-Deoxydaunomycinone (19).** Daunomycinone (16, 29.2 mg, 0.073 mmol) and *p*-toluenesulfonylhydrazide (20 mg) were placed in EtOH (100 mL) and refluxed for 6 h. The solvent was removed, and the residue was placed with *p*-toluenesulfonic acid (7.0 mg) and NaCNBH<sub>3</sub> (40 mg) in 1:1 DMF-sulfolane (4 mL) and stirred at 100 °C under N<sub>2</sub> for 1 h. The reaction mixture was allowed to cool, quenched with saturated NH<sub>4</sub>Cl (20 mL), and extracted with benzene (3  $\times$  10 mL). The extracts were combined, washed with H<sub>2</sub>O (2  $\times$  10 mL), saturated NaHCO<sub>3</sub> (10 mL), and saturated NaCl (10 mL), dried, and evaporated. The residue was chromatographed (PLC 95:5 CHCl<sub>3</sub>-MeOH) to afford 5.3 mg (19%) of 19: IR 2.90 (OH), 6.20, 6.30  $\mu\text{m}$  (H-bonded quinone); NMR  $\delta$  1.11 (t, 3, 14-H<sub>3</sub>), 1.75 (q, 2, 13-H<sub>2</sub>), 2.18-2.64 (m, 2, 8-H<sub>2</sub>), 3.10-3.45 (m, 2, 10-H<sub>2</sub>), 4.09 (s, 3, OMe), 5.29 (br s, 1, 7-H), 7.35 (dd, 1, *J* = 8 Hz and *J* = 1 Hz, 3-H), 7.76 (t, 1, *J* = 8 Hz, 2-H), 8.02 (dd, 1, *J* = 8 Hz and *J* = 1 Hz, 1-H), 13.30 (s, 1, phenolic OH), 13.99 (s, 1, phenolic OH); MS (12 eV) *m/e* (%) 384 M (100), 366 (88), 348 (58); TLC (95:5 CHCl<sub>3</sub>-MeOH) *R*<sub>f</sub> 0.33. Anal. (C<sub>21</sub>H<sub>20</sub>O<sub>7</sub>) C, H.

**Daunorubicin 13-Tosylhydrazone Hydrochloride (4).** Daunorubicin hydrochloride (1, 354.4 mg, 0.628 mmol) and *p*-toluenesulfonylhydrazide (213 mg) were placed in MeOH (144 mL) and allowed to stand for 7 days at 23 °C. The solvent was removed and the residue precipitated from MeOH-ether to afford 433.2 mg (94%) of 4: IR 2.95, 3.15 (OH, NH), 6.00, 6.30 (H-bonded quinone), 8.60  $\mu\text{m}$  (-SO<sub>2</sub>-); NMR (Me<sub>2</sub>SO-*d*<sub>6</sub>)  $\delta$  1.18 (d, 3, 6'-H<sub>3</sub>), 1.6-2.1 (m, 7, 8- and 2'-H<sub>2</sub>'s, 14-H<sub>3</sub>), 2.30 (s, 3, Ar Me), 2.7-3.1 (m, 2, 10-H<sub>2</sub>), 3.57 (m, 2, 3'- and 4'-H's), 4.03 (s, 4, OMe and 5'-H),

4.90 (br s, 1, 7-H), 5.30 (br s, 1, 1'-H), 5.44 (m, 1, 9-OH), 7.06 (d, 2, Ar H's), 7.6–8.0 (m, 5, Ar H's); UV  $\lambda_{\max}$  (MeOH) 234 nm ( $\epsilon$  42 196), 252 (28 794), 291 (7892);  $[\alpha]_D^{20} +320^\circ$  (c 0.020, MeOH); TLC (30:10:1 CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O)  $R_f$  0.28. Anal. (C<sub>34</sub>H<sub>37</sub>N<sub>3</sub>O<sub>11</sub>S·HCl·2H<sub>2</sub>O) C, H, N.

**Adriamycin 13-Tosylhydrazone Hydrochloride (5).** Adriamycin hydrochloride (2, 1.00 g, 0.175 mmol) and *p*-toluenesulfonylhydrazide (1.00 g) were placed in MeOH (300 mL) and allowed to stand at 23 °C for 5.5 days. The solvent was removed and the residue was precipitated with MeOH-ether to afford 1.26 g (95%) of 5: IR 2.95 (OH, NH), 6.19, 6.31 (H-bonded quinone), 8.58  $\mu$ m (–SO<sub>2</sub>–); NMR 1.6–2.4 (m, 7, 8- and 2'-H<sub>2</sub>'s, Ar Me), 2.7–3.1 (m, 2, 10-H<sub>2</sub>), 3.56 (m, 2, 3'- and 4'-H's), 4.03 (s, 4, OMe and 5'-H), 4.33 (s, 2, 14-H<sub>2</sub>), 4.95 (m, 1, 7-H), 5.32 (m, 2, 1-H and 9-OH), 7.2–8.0 (m, 7, Ar H's); UV  $\lambda_{\max}$  (MeOH) 234 nm ( $\epsilon$  37 806), 252 (26 685), 291 (8285);  $[\alpha]_D^{20} +421^\circ$  (c 0.022, MeOH); TLC (30:10:1 CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O)  $R_f$  0.31. Anal. (C<sub>34</sub>H<sub>37</sub>N<sub>3</sub>O<sub>12</sub>S·HCl·2H<sub>2</sub>O) C, H, N.

**13-Deoxydaunorubicin Hydrochloride (6).** Daunorubicin 13-tosylhydrazone hydrochloride (4, 163.7 mg, 0.213 mmol), NaCNBH<sub>3</sub> (213 mg), and *p*-toluenesulfonic acid (150 mg) were placed in MeOH (16 mL) and refluxed under N<sub>2</sub> for 0.5 h. The reaction mixture was poured into saturated NaHCO<sub>3</sub>-ice (20 mL) and extracted with CHCl<sub>3</sub>-MeOH (9:1, 3 × 10 mL). The extracts were combined and extracted with 0.5 M citric acid (2 × 15 mL). The acid extracts were combined, neutralized with saturated NaHCO<sub>3</sub>, and extracted with CHCl<sub>3</sub>-MeOH (9:1, 4 × 15 mL). The extracts were combined, dried, and evaporated. The residue (12.3 mg) was dissolved in MeOH (1 mL) and cooled to 0 °C. HCl (54  $\mu$ L of 0.40 M solution in ether) was added and the hydrochloride precipitated by addition of ether (30 mL). The solvent was removed and the residue chromatographed [E. Merck silica gel 60 (size A prepacked column) 30:10:1 CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O] to afford 34.0 mg (29%) of 6: IR 2.95 (OH), 6.20, 6.30  $\mu$ m (H-bonded quinone); NMR (Me<sub>2</sub>SO-*d*<sub>6</sub>)  $\delta$  0.93 (t, 3, 14-H<sub>3</sub>), 1.16 (d, 3, 6'-H<sub>3</sub>), 1.5 (m, 2, 2'-H<sub>2</sub>), 1.7–2.1 (m, 4, 8- and 13'-H<sub>2</sub>'s), 2.8–3.8 (m, H<sub>2</sub>O, 10-H<sub>2</sub>, 3'- and 4'-H's), 4.02 (s, 4, OMe and 5'-H), 4.88 (br s, 1, 7-H), 5.31 (br s, 1, 1'-H), 7.6–7.9 (m, 3, 1-, 2-, and 3-H's), 13.26 (s, 1, phenolic OH), 14.06 (s, 1, phenolic OH); UV-visible  $\lambda_{\max}$  (MeOH) 243 nm ( $\epsilon$  31 620), 251 (26 315), 284 (10 319), 478 (9946), 495 (9969), 529 (6651);  $[\alpha]_D^{20} +193^\circ$  (c 0.041, MeOH); TLC (30:10:1 CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O)  $R_f$  0.39. Anal. (C<sub>27</sub>H<sub>31</sub>NO<sub>9</sub>·HCl·0.5H<sub>2</sub>O) C, H, N.

**13-Deoxyadriamycin Hydrochloride (7).** Adriamycin 13-tosylhydrazone hydrochloride (5, 916 mg, 1.168 mmol), NaCNBH<sub>3</sub> (1.19 g), and *p*-toluenesulfonic acid (90.0 mg) were dissolved in MeOH (90 mL) and refluxed under N<sub>2</sub> for 0.5 h. The reaction mixture was poured into saturated NaHCO<sub>3</sub>-ice (150 mL) and extracted with CHCl<sub>3</sub>-MeOH (3:1, 5 × 50 mL). The aqueous portion was placed on a 2 × 40 cm column of XAD-2 resin, washed with H<sub>2</sub>O (200 mL), and eluted with MeOH (200 mL), MeOH-benzene (1:1), and MeOH (100 mL). The eluents were combined and evaporated, and the residue was partitioned between CHCl<sub>3</sub>-MeOH (3:1) and saturated NaHCO<sub>3</sub>. The organic phase was separated, dried, combined with the original extract, and evaporated. The residue was dissolved in a minimum amount of CHCl<sub>3</sub>-MeOH (3:1) and cooled to 0 °C. HCl (3.0 mL of a 0.4 M solution in MeOH) was added, followed by ether (100 mL). The precipitate was collected and chromatographed (E. Merck prepacked silica gel 60 column, size B, 30:10:1 CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O) to afford 215.7 mg (33%) of 7: IR 2.95 (OH), 6.18, 6.30 (H-bonded quinone), 9.82, 10.10  $\mu$ m; NMR (Me<sub>2</sub>SO-*d*<sub>6</sub>)  $\delta$  1.16 (d, 3, 6'-H<sub>3</sub>), 1.70 (m, 2, 2'-H<sub>2</sub>), 2.07 (m, 2, 8-H<sub>2</sub>), 2.76 (m, 2, 13-H<sub>2</sub>), 3.09–3.76 (m, 6, 3'- and 4'-H's and 10- and 14-H<sub>2</sub>'s), 4.02 (s, 4, OMe and

5'-H), 4.85 (br s, 1, 7-H), 5.26 (br s, 1, 1'-H), 7.67 (m, 1, 3-H), 7.91 (m, 2, 1- and 2-H's), 13.26 (s, 1, phenolic OH), 14.06 (s, 1, phenolic OH); UV  $\lambda_{\max}$  (MeOH) 237 nm (29 557), 249 (23 868), 286 (8059);  $[\alpha]_D^{20} +151^\circ$  (c 0.041, MeOH); TLC (30:10:1 CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O)  $R_f$  0.23. Anal. (C<sub>27</sub>H<sub>31</sub>NO<sub>10</sub>·HCl·<sup>2</sup>/<sub>3</sub>H<sub>2</sub>O) C, H, N.

**Acknowledgment.** This work was supported by Contract No. NO1-CM-33742 from the Division of Cancer Treatment, National Cancer Institute, Department of Health, Education and Welfare. The authors thank Dr. William T. Bradner of Bristol Laboratories for a generous gift of  $\epsilon$ -rhodomycinone. We are grateful to Dr. Harry B. Wood, Jr., of NCI for providing the antitumor test data and to Dorris Taylor, Nancy Charbeneau, and Charlotte Elder for capably providing the in vitro test data.
