Plant Antitumor Agents. 18.1 Synthesis and Biological Activity of Camptothecin Analogues

Mansukh C. Wani,* Peter E. Ronman, James T. Lindley, and Monroe E. Wall*

Research Triangle Institute, Research Triangle Park, North Carolina 27709. Received October 5, 1979

Four analogues, 10-methoxy (20), 12-aza (29), benz[j] (36), and 18-methoxy (38), of camptothecin were obtained by total synthesis. The two water-soluble analogues, 10-[(carboxymethyl)oxy]- (24) and 10-[2'-(diethylamino)ethoxy]-20(S)-camptothecin (26), with intact ring E were prepared from natural 10-hydroxycamptothecin (3). In general, there was a good correlation between in vitro 9KB cytotoxicity and activity in the P-388 leukemia system. While the aza analogue 29 was active in P-388 only at a much higher dose level than natural camptothecin (1), the 18-methoxy analogue 38 exhibited activity comparable to that of 1. The water-soluble derivative 24 was inactive. The amine hydrochloride 26 showed excellent activity at a high dose level. This could be due to its hydrolysis to 3. dl-Camptothecin (17) was roughly half as active as 1, indicating that the l isomer is inactive.

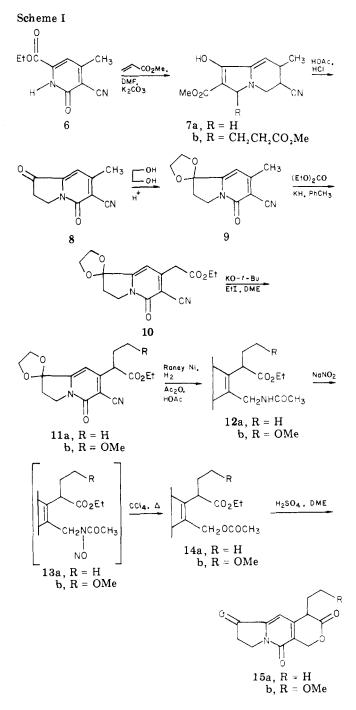

Camptothecin (1), a pentacyclic alkaloid isolated from

the wood and bark of Camptotheca acuminata by Wall and co-workers, displayed excellent antitumor activity in animal testing with the rapeutic indices greater than $10.^2$ Camptothecin, however, was highly insoluble in water. It was found that the sodium salt (2) of camptothecin was water soluble and active in animal trials, although a good comparison of the antitumor activity of the sodium salt and 1 was not conducted until recently.³ Unfortunately, initially encouraging reports⁴ on favorable activity of the sodium salt of 1 in gastrointestinal carcinoma could not be confirmed by later studies.^{5,6} As a result, there has been considerable research interest in the synthesis of analogues of 1.

Studies from this laboratory have established some important parameters for antitumor activity in the camptothecin series.⁷ It has been shown that the α -hydroxy lactone moiety present in ring E is an absolute requirement for antitumor activity. The 20-ethyl substituent in ring E can be replaced by groups such as allyl and propargyl, with the allyl analogue being more active than 1.8 Oxygenated ring A analogues 3-5 are highly active in both L-1210 and P-388 leukemia systems, thus indicating that substitution in ring A is compatible with biological activity. A large number of ring DE and CDE analogues are inactive $^{9-12}$ as antitumor agents, indicating that factors other

than the α -hydroxy lactone moiety are required for biological activity. In order to further delineate the structural parameters for biological activity, we have continued our work on the synthesis of camptothecin analogues. This report describes the synthesis of several analogues from the key tricyclic intermediates 15a and 15b. It also describes the biological activity of these analogues and of some new water-soluble analogues.

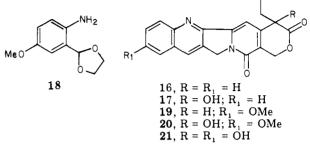

Chemistry. The synthesis of the key tricyclic intermediate 15a is shown in Scheme I. This synthetic sequence is a modification of the procedure used by the Chinese workers.^{13,14} The known pyridinone 6^{15} was converted to the bicyclic pyridinone $\overline{7}$ by treatment with methyl acrylate and K_2CO_3 in dimethylformamide. When this was done using the Chinese conditions of a higher temperature (70 °C instead of 45 °C), it was found that 2 mol of methyl acrylate was added, forming 7b as the exclusive product instead of 7a. By reducing the temperature to 45 °C, a 75% yield of 7a could be realized. Hydrolysis and decarboxylation of 7a to the ketone 8 were effected by refluxing in a mixture of HOAc and concentrated HCl under nitrogen. Without a nitrogen atmosphere, the product 8 quickly decomposed. Ketone 8 was, however, stable in a crystalline form. Ketalization did not proceed unless a two-phase system of toluene and ethylene glycol was used. The ketone was converted to the ketal 9 plus a side product, the enol ether of the ketone 8. The enol ether remained in the ethylene glycol phase and the ketal, being somewhat more hydrophobic, partitioned into the toluene layer. The toluene layer containing nearly pure ketal could be decanted and fresh toluene added so that the enol ether in the ethylene glycol layer could be converted to the ketal. Using this procedure, the original yield of 40% was increased to more than 90%. Construction of the E ring began with functionalization of the methyl group. Unless the ketal 9 was absolutely pure, its reaction with diethyl carbonate in the presence of potassium hydride would not proceed. Trace amounts of impurity 7a completely suppressed the reaction, resulting in recovered ketal 9 instead of the product 10. An important improvement over the literature procedure^{13b} was the use of potassium tert-butoxide, dimethoxyethane, and EtI for the ethylation of 10. The yield was increased from 80 to 98% but, more importantly, the difficult separation of 10 and 11a was avoided.

At this stage, our synthetic scheme deviated from that of the Chinese workers. Catalytic hydrogenation of 11a in the presence of Raney Ni in a mixture of Ac₂O and HOAc gave the amide 12a. Removal of the catalyst by filtration followed by the addition of NaNO₂ to the filtrate gave the N-nitroso amide 13a. If decomposition of the *N*-nitroso amide 13a was attempted in HOAc and $Ac_{2}O_{1}$ no product resulted. However, by isolating the N-nitroso derivative which was relatively stable and decomposing it by heating in an inert solvent (CCl_4), a good yield (>90%)

of the acetate 14a resulted. The Chinese workers attempted to prepare this intermediate but were unsuccessful.^{13b} The diester 14a was lactonized by 2 N H₂SO₄ in dimethoxyethane with simultaneous deketalization to give the intermediate 15a (40% overall yield from 6).

Friedlander condensation of the ketone 15a with N-(oaminobenzylidene)-p-toluidine¹⁶ in the presence of an acid catalyst gave the known 20-deoxycamptothecin (16),16

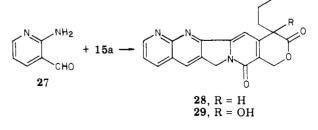

which was oxidized to dl-camptothecin (17) by passing oxygen through a solution of 16 in dimethylformamide in the presence of CuCl₂.¹⁶ Similarly, Friedlander condensation of the o-amino acetal 18 with 15a gave dl-10methoxy-20-deoxycamptothecin (19). The latter on oxidation¹⁶ gave dl-10-methoxycamptothecin (20), which was identical with natural 10-methoxycamptothecin $(4)^{17}$ by TLC and spectral properties. Demethylation of 20 in refluxing hydrobromic acid gave dl-10-hydroxycamptothecin (21), which was identical with natural 10-hydroxycamptothecin $(3)^{17}$ by TLC and spectral properties.

The water-soluble analogues 24 and 26 were prepared from the natural 10-hydroxycamptothecin (3) rather than from the racemic isomer 21. Thus, alkylation of 3 with ethyl bromoacetate in refluxing acetone in the presence of anhydrous K_2CO_3 gave 22. In dilute base the carb-

ethoxymethyloxy derivative 22 was hydrolyzed to the acid 23, which was then converted to the sodium salt 24 by treatment with NaHCO₃. Alkylation of 3 with 2-(diethylamino)ethyl chloride in dimethylformamide in the presence of anhydrous K₂CO₃ gave the diethylaminoethyl derivative 25, which was then converted to the hydrochloride 26 by treatment with anhydrous HCl in Et_2O .

dl-12-Aza-20-deoxycamptothecin (28) was obtained in

^a Inactive.

50% yield by condensing 2-amino-3-formylpyridine $(27)^{18}$ with ketone 15a. Oxidation¹⁶ of 28 gave dl-12-azacamptothecin (29) in poor yield (24%) partly because of the difficulty in separating 29 from the cupric salts used in the oxidation step.

The hexacyclic analogue, dl-benz[j]camptothecin (36), was made starting with 3-nitro-2-naphthoic acid (30)¹⁹ (Scheme II). Reduction of 30 with diborane in tetrahydrofuran gave the alcohol 31, which was oxidized with activated MnO₂ in chloroform to the aldehyde 32. The latter upon treatment with ethylene glycol in refluxing toluene in the presence of *p*-toluenesulfonic acid gave the acetal 33. Reduction of the nitro acetal 33 with H₂ in the presence of Pt gave the amino acetal 34, which condensed smoothly with ketone 15a to give dl-benz[j]-20-deoxycamptothecin (35). Oxidation¹⁶ of 35 gave the hexacyclic analogue 36.

The synthesis of the ring E analogue, dl-18-methoxycamptothecin (38), was accomplished by using a sequence similar to that used for dl-camptothecin (17). Instead of alkylating the bicyclic pyridinone 10 with EtI, a different set of conditions employing 2-methoxyethyl bromide in dimethylformamide in the presence of potassium *tert*butoxide gave the alkylated product 11b in 61% yield. The same sequence outlined in Scheme I then gave the tricyclic ketone 15b, which upon condensation with N-(o-aminobenzylidene)-p-toluidine¹⁶ gave the deoxy analogue 37. Oxidation¹⁶ of the latter as before led to the desired analogue 38.

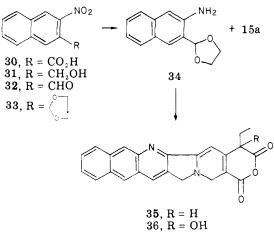

Biological Activity. The results of in vitro cytotoxicity (9KB) and in vivo P-388 leukemia (PS) bioassays are shown in Table I. The 9KB tests were conducted at the Research Triangle Institute and the PS assays by National Cancer Institute contractors using standard procedures.²⁰ In general, there was excellent correlation between 9KB and PS data in the compounds under study.

Discussion

In the course of our studies it has become evident that the antitumor activity of camptothecin involves two

structural factors: (1) the flat, planar aromatic structure inherent in rings A, B, C, and D which may be responsible for intercalation and has been shown by Horwitz²¹ to be responsible for the inhibition of RNA synthesis and DNA depolymerization, and (2) the α -hydroxy lactone moiety in ring E which Wall²² has shown to be a requisite for antitumor activity. Recently, Adamovics and Hutchinson²³ reported the synthesis of several camptothecin analogues in which ring E was converted to open-chain amide derivatives. These compounds were somewhat less active than 1 and their activity could be due to relactonization to 1 in vivo. One of the amide analogues was converted to another derivative which could no longer be relactonized and was completely inactive in "in vivo" leukemia systems. Analogues can be highly active as DNA and RNA inhibitors but inactive as antitumor agents; for example, deoxycamptothecin which lacks the α -hydroxy group is about equipotent to camptothecin in the inhibition of RNA synthesis and production of DNA depolymerization²¹ but is totally inactive in in vivo leukemia systems.²²

Camptothecin and the analogues described in this paper could be placed in three categories: (1) Analogues with the highest in vivo and in vitro activity. In this category were the various naturally occurring optically active alkaloids, including camptothecin 1 and its hydroxy (3) and methoxy (4) analogues. These compounds all had 9KB activity of the order of $ED_{50} = 0.02 \ \mu g/mL$. PS leukemia activity in this group was generally very high and was associated with high potency. Compound 3 was clearly the

Camptothecin Analogues

most potent and active compound in this group. (2) Analogues with intermediate activity. This group included compounds with 9KB activity of the order of $ED_{50} = 0.1 \mu g/mL$, e.g., the synthetic camptothecin analogues 17, 36, 38, and the optically active water-soluble sodium salt 2. PS activity was frequently high, but potency was lower than that of group 1. (3) Analogues which are weakly active or inactive. This group included inactive or weakly active compounds with ED_{50} values >1.0. Activity in PS when found occurred only at high dose levels. This category included the synthetic 12-aza analogue 29 and two water-soluble salts 24 and 26.

Our present synthetic studies had two objectives in mind. The first was to prepare water-soluble analogues of camptothecin which might show better potency than 2. As noted in Table I, compound 2 has only one-tenth the potency of 1, although it is of the same order of activity as 1 at high dose levels. When 2 was administered by the intravenous (iv) route to mice, it was inactive in L-1210 leukemia, although it was of the same order of activity as 1 in L-1210 by the intraperitoneal (ip) route. These results suggest that 2 is inefficiently relactonized to 1 under ip conditions and at pH 7.2 (iv conditions) is not relactonized at all. Accordingly, we prepared the salts 24 and 26 which would not require relactonization for activity.

The selection of 10-hydroxycamptothecin (3) for this purpose was based on the strong activity of this compound. In the event the carboxy sodium salt 24 was totally inactive, the amine hydrochloride 26 had good activity at high dose levels but no cytotoxicity. From preliminary studies, we have reason to believe that the activity of 26 may be due to hydrolysis to $3.^{24}$ Hence, 26 may have some therapeutic possibilities as a *nontoxic*, *prodrug* for 3. The inactivity of 24 and 26 may be due to steric or electronic interactions.

The availability of the tricyclic intermediate 15a permitted us to survey other structure-function parameters. and this was a second objective of our studies. Although many syntheses of racemic camptothecin have been published, to the best of our knowledge none provided sufficient quantity for even minimal biological in vivo evaluation. dl-Camptothecin (17) showed cytotoxicity about one-tenth and P-388 leukemia activity about one-half that of 1; i.e., maximal activity of 17 was observed at 8 mg/kg; for 1, maximal activity was found at 4 mg/kg. Thus, it is evident that the S configuration of natural camptothecin is required for maximal antitumor activity. The lower 9KB cytotoxicity of 17 may indicate that the S configuration may be an *important factor* in DNA intercalation or binding also. The synthesis of compound 38 is the first approach to placing more polar substituents elsewhere in the molecule. The prior work of Sugasawa⁸ had indicated that considerable modification of the alkyl substituent at C-20 was compatible with activity. The dl-18-methoxy analogue 38 was comparable in activity to dl-camptothecin 17 but somewhat more toxic. The 12-aza-analogue 29 was synthesized to determine the effect of replacing a benzene ring with a pyridine ring. We expected to find activity of 29 at least of the same order as 17. Surprisingly, it was only of the order of one-eighth the activity of 17.

We have subsequently been informed²⁵ that naphthyridine compounds which have ring AB systems similar to 29 complex with metals via the adjacent nitrogen atoms. If a similar metal complex were formed from 29, steric or electronic interference of its binding with nucleic acid might occur. 10-Azacamptothecin, an isomer of 29, is now in preparation to explore this hypothesis.

Finally, we should like to comment on the excellent predictability of the 9KB assay for in vivo activity in the camptothecin series. To be reliable it must be emphasized that new camptothecin analogues should always be tested against positive controls such as 1, 2, and 17.

Experimental Section

Melting points (Kofler hot-stage microscope) are uncorrected. Infrared spectra were measured with a Perkin-Elmer 467 spectrophotometer. NMR spectra were recorded on a Varian Model HA-100 using Me₄Si as an internal standard. Chemical shifts are expressed in δ units. Only significant spectral data are reported. Mass spectra were recorded with an Associated Electrical Industries MS-902 instrument. Where analyses are indicated by mass spectra, the homogeneity of these compounds was established by TLC and other spectral properties. Microanalyses were carried out by Integral Microanalytical Laboratories, Inc., Raleigh, N.C. Each compound had IR and NMR spectra compatible with its structures. Analytical results were within $\pm 0.4\%$ of the theoretical values. All reactions were carried out under N₂ unless otherwise specified.

2-(Methoxycarbonyl)-6-cyano-7-methyl-1,5-dioxo- $\Delta^{6(8)}$ tetrahydroindolizine (7a). Anhydrous, powdered K₂CO₃ (12.6 g, 0.091 mol) was added to a solution of pyridinone 6¹⁵ (18.0 g, 0.87 mol) in DMF (500 mL), and the mixture was heated at 45 °C in a water bath. After the formation of a bright yellow suspension (typically 5–10 min), methyl acrylate (62 g, 0.73 mol) was added over a 10-min period and the reaction mixture was stirred vigorously at 45 °C for 40 h. The progress of the reaction was followed by TLC [SiO₂; toluene-dioxane-HOAc (90:25:4)]. The precipitate was filtered, and the residue was suspended in H₂O (500 mL) and acidified to pH 1.5 (concentrated HCl). The product was filtered and purified by crystallization from aqueous HOAc (15.9 g, 74%): mp 250 °C dec (lit.¹³ 250 °C dec).

2-(Methoxycarbonyl)-3-[2'-(methoxycarbonyl)ethyl]-6cyano-7-methyl-1,5-dioxo- $\Delta^{6(8)}$ -tetrahydroindolizine (7b). A solution of 7a (100 mg, 0.406 mmol), anhydrous K₂CO₃ (84 mg, 0.609 mmol), and methyl acrylate (350 mg, 4.06 mmol) in DMF (2.5 mL) was heated on a steam bath for 10 h. The solution was cooled and then filtered. The precipitate was suspended in H₂O (5 mL) and acidified to pH 1.5 (concentrated HCl). The product was filtered and crystallized from MeOH (105 mg, 78%): mp 178-179 °C; IR ν_{mar} (CHCl₃) 1730 (ester C=O), 1665 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 1.87 (m, 2, CH₂-COR), 2.52 (s, 3, CH₃), 3.0 (m, 2, CHCH₂CH₂CO₂Me), 3.53 (s, 3, CO₂CH₃), 3.90 (s, 3, CO₂CH₃), 5.30 (t, 1, J = 2 Hz, CHCH₂), 6.47 (s, 1, aromatic). Aual. (C₁₆H₁₆N₂O₆) C, H, N.

6-Cyano-7-methyl-1,5-dioxo- $\Delta^{6(8)}$ -tetrahydroindolizine (8). A solution of the keto ester 7a (22.5 g, 0.091 mol) in a mixture of acetic acid (225 mL) and concentrated HCl (225 mL) was refluxed for 2 h. The acid solution was extracted with CH₂Cl₂ until TLC [SiO₂; CHCl₃-acetone-MeOH (75:20:5)] showed the absence of ketone in the aqueous phase. The combined extracts were washed with brine, dried (Na₂SO₄), and evaporated. The resulting solid was crystallized from acetone to yield 8 (15.3 g, 89%): mp 219 °C (lit.^{13b} 210 °C).

6-Cyano-1,1-(ethylenedioxy)-7-methyl-5-oxo-Δ⁶⁽⁸⁾-tetrahydroindolizine (9). A mixture of the ketone 8 (13.0 g, 0.069 mol), ethylene glycol (210 mL), and *p*-toluenesulfonic acid (1.1 g) in toluene (1.0 L) was refluxed using a Dean-Stark trap for 5 h. The toluene layer was decanted and another liter of toluene was added. The reaction mixture was refluxed for an additional 5 h and the toluene layer decanted as before. After repeating this procedure two more times, the toluene layers were combined, washed with brine, dried (Na₂SO₄), and evaporated to yield the crude product, which was crystallized from MeOH to give 9 (14.9 g, 93%): mp 191-192 °C (lit.^{13b} 192 °C).

6-Cyano-1,1-(ethylenedioxy)-7-[(ethoxycarbonyl)methyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (10). To a suspension of KH (11.9 g, 0.068 mol; the 23% dispersion of KH in mineral oil was washed twice with hexane and once with toluene before use) in toluene (40 mL) was added the ketal 9 (5.0 g, 0.022 mol).

⁽²⁴⁾ In an aqueous solution, the amine hydrochloride 26 slowly undergoes hydrolysis to 3 as indicated by TLC. The sodium salt 24 is relatively stable under aqueous conditions.

⁽²⁵⁾ Private communication from Dr. S. G. Levine, whom we thank.

The purity of the ketal was very critical for the success of the reaction. The reaction mixture was refluxed for 10 min before adding diethyl carbonate (6.79 g, 0.058 mol) and a catalytic amount (0.31 g, 6.7 mmol) of absolute ethanol over a period of 5 min. After refluxing the reaction mixture for 3 h, the hard, dark solid was crushed and the resulting suspension filtered. The dry potassium salt was decomposed by very cautious addition to cold aqueous acetic acid. It was then diluted with H₂O (100 mL) and the resulting suspension for the dry Dotas in the organic phase was washed with brine, dried (Na₂SO₄), and evaporated to yield the crude product, which was purified by elution from silica gel with 2% MeOH in CHCl₃, followed by crystallization from MeOH (4.97 g, 76%): mp 172–173 °C (lit.^{13b} 173 °C).

6-Cyano-1,1-(et hylenedioxy)-7-[1'-(et hoxycarbonyl)propyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (11a). To a solution of ester 10 (4.01 g, 0.0132 mol) in anhydrous DME (70 mL) cooled to -78 °C was added potassium *tert*-butoxide (1.7 g, 15 mmol), and the resulting mixture was allowed to stir for 5 min before adding ethyl iodide (8.24 g, 0.053 mol) over a period of 5 min. The reaction mixture was stirred for 1.5 h at -78 °C, then allowed to warm to room temperature, and stirred overnight. After dilution of the mixture with H₂O (60 mL), the aqueous phase was extracted with CH₂Cl₂ (3 × 50 mL). The organic phase was washed with brine, dried (Na₂SO₄), and evaporated to yield the ester 11a (4.3 g, 98%) of sufficient purity for the next step. A small sample was crystallized from CHCl₃: mp 126-127 °C (lit.^{13b} 122-123 °C).

6-Cyano-1,1-(ethylenedioxy)-7-[1'-(ethoxycarbonyl)-3'methoxypropyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (11b). A solution of ester ketal 10 (1.50 g, 4.93 mmol) in DMF (30 mL) was cooled in an ice bath and potassium tert-butoxide (0.656 g, 5.86 mmol) was added. After the solution was stirred for 10 min, 2-methoxyethyl bromide (4.02 g, 28.9 mmol) was added and the ice bath exchanged for an oil bath at 50 °C. The reaction mixture was stirred at 50 °C for 24 h, diluted with water (400 mL), and extracted with CH_2Cl_2 (4 × 100 mL). The combined CH_2Cl_2 extracts were washed with H2O, dried (Na2SO4), and evaporated to give a crude solid, which was chromatographed (EM silica gel 60 prepacked column, 30% hexane-EtOAc) to give a white solid (1.09 g, 61%): mp 101–102 °C; IR ν_{max} (CHCl₃) 2230 (CN), 1730 (ester C=O), 1660 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 1.23 (t, 3, J = 7 Hz, CH₂CH₃), 1.90 (m, 2, CHCH₂CH₃), 2.37 (t, 2, J= 7 Hz, $CH_2 \alpha$ to ketal), 3.28 (s, 3, OCH_3), 3.35 (m, 2, CH_2OCH_3), 4.13 (s, 4, OCH₂CH₂O), 6.27 (s, 1, aromatic). Anal. (C₁₈H₂₂N₂O₆) C, H, N.

6-(Acetamidomethyl)-1,1-(ethylenedioxy)-7-[1'-(ethoxycarbonyl)propyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (12a). A solution of ester 11a (2.0 g, 6.0 mmol) in a mixture of acetic anhydride (30 mL) and acetic acid (10 mL) was hydrogenated in the presence of Raney nickel (3 g; prewashed with acetic acid) during 6 h at 45 °C under 50 psi. The progress of the reaction was followed by TLC [SiO₂, CHCl₃-acetone-MeOH (75:20:5)]. The catalyst was removed by filtration, and the solvent was removed in vacuo to yield a crude oil (2.3 g, 100%), which was pure enough for the next step. A small sample was purified by column chromatography (silica gel 60, 2% MeOH-CHCl₃). Although homogeneous by TLC, attempted crystallization of 12a was unsuccessful: IR ν_{max} (CHCl₃) 3440 (NH), 1725 (ester C=O), 1665 (amide C==O), 1655 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 0.90 (t, 3, J = 4 Hz, CH₂CH₃), 1.18 (t, 3, J = 7 Hz, OCH₂CH₃), 1.8 (m, 2, CH_2CH_3), 1.90 (s, 3, $COCH_3$), 2.35 (t, 2, J = 7 Hz, CH_2 α to ketal), 3.70 (t, 1, J = 7 Hz, CHCH₂), 4.10 (s, 4, OCH₂CH₂O), 6.26 (s, 1 aromatic), 6.8 (br s, NH). Anal. $(C_{19}H_{26}N_2O_6) m/e$ 378.179.

6-(Acetamidomethyl)-1,1-(ethylenedioxy)-7-[1'-(ethoxycarbonyl)-3'-methoxypropyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (12b). The title compound was obtained from 11b in exactly the same manner as 12a. Although homogeneous by TLC, attempted crystallization of 12b was unsuccessful: IR ν_{max} (CHCl₃) 1725 (ester C==O), 1665 (shoulder, amide C==O), 1655 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 1.17 (t, 3, J = 7 Hz, OCH₂CH₃), 1.90 (s, 3, COCH₃), 2.1 (m, 2, CHCH₂CH₃), 2.35 (t, 2, J = 7 Hz), 3.24 (s, 3, OCH₃), 3.28 (m, 2, CH₂OCH₃), 4.09 (s, 4, OCH₂CH₂O), 6.28 (s, 1, aromatic), 6.8 (br s, NH). Anal. (C₂₀H₂₈N₂O₇) m/e 408.190.

6-(Acetoxymethyl)-1,1'-(ethylenedioxy)-7-[1'-(ethoxy-carbonyl)propyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (14a). To

a cooled solution of the amide 12a (2.3 g, 6.0 mmol) in acetic anhydride (30 mL) and acetic acid (10 mL) was added NaNO₂ (1.8 g, 26 mmol) and the reaction mixture stirred for 2 h at 0 °C. The inorganic salts were removed by filtration and the solvent was removed in vacuo at room temperature to leave the N-nitroso intermediate 13a as an oil, which was converted directly to the acetate 14a by refluxing overnight in CCl₄. The CCl₄ solution was washed with H₂O and dried (Na₂SO₄), and the solvent was removed in vacuo to give an oil (2.3 g, 100%) which was used without further purification: IR ν_{max} (CHCl₃) 1730 (ester C==O), 1665 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 0.88 (t, 3, J = 6 Hz, CH₂CH₃), 1.18 (t, 3, J = 7 Hz, OCH₂CH₃), 1.8 (m, 2, CH₂CH₂CH₃), 2.02 (s, 3, OAc), 2.32 (t, 2, J = 6 Hz, CH₂ α to ketal), 3.73 (t, 1, J = 7 Hz, CHCH₂), 4.08 (s, 4, OCH₂CH₂O), 5.18 (s, 2, ArCH₂O), 6.23 (s, 1, aromatic). Anal. (C₁₉H₂₅NO₇) m/e 379.163.

6-(Acetoxymethyl)-1,1-(ethylenedioxy)-7-[1'-(ethoxycarbonyl)-3'-methoxypropyl]-5-oxo- $\Delta^{6(8)}$ -tetrahydroindolizine (14b). The title compound was obtained from 12b in exactly the same manner as 14a. Although homogeneous by TLC, attempted crystallization of 14b was unsuccessful: IR ν_{max} (CHCl₃) 1730 (ester and acetate C==O), 1660 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 1.17 (t, 3, J = 7 Hz, OCH₂CH₃), 2.00 (s, 3, OAc), 2.1 (m, 2, CHCH₂CH₃), 2.30 (t, 2, J = 7 Hz, CH₂ α to ketal), 3.23 (s, 3, OCH₃), 3.27 (m, 2, CH₂OCH₃), 4.07 (s, 4, OCH₂CH₂O), 5.17 (s, 2, ArCH₂O), 6.18 (s, 1, aromatic). Anal. (C₂₀H₂₇NO₈) m/e 409.173.

1,5-Dioxo(5'-ethyl-2' H,5' H,6' H-6-oxopyrano)[3',4'-f]- $\Delta^{6(8)}$ -tetrahydroindolizine (15a). The diester ketal 14a (2.38 g, 6.0 mmol) was dissolved in DME (15 mL) and 2 N H₂SO₄ (15 mL) and stirred at 50 °C for 24 h. The reaction mixture was concentrated to approximately 10 mL in vacuo and then extracted with CH₂Cl₂ (3 × 20 mL). The organic phase was washed with H₂O, dried (Na₂SO₄), and evaporated to yield an oil, which was crystallized from EtOAc to yield 15a (1.31 g, 88%): mp 162-163 °C; IR ν_{max} (CHCl₃) 1750 (shoulder, ketone), 1745 (lactone), 1660 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 1.00 (t, 3, J = 7 Hz, CH₃), 1.90 (m, 2, CH₂CH₃), 2.93 (t, 2, J = 7 Hz, CH₂CO), 3.50 (m, 1, CHCH₂), 4.32 (t, 2, J = 7 Hz, CH₂N), 5.33 (s, 2, ArCH₂O), 6.67 (s, 1, aromatic). Anal. (C₁₃H₁₃NO₄) C, H, N.

1,5-Dioxo[5'-(methoxyethyl)-2'H,5'H,6'H-6-oxopyrano]-[3',4'-f]- $\Delta^{6(8)}$ -tetrahydroindolizine (15b). The title compound was obtained from 14b in 76% yield in exactly the same manner as 15a. Although homogeneous by TLC, attempted crystallization of 15b was unsuccessful: IR ν_{max} (CHCl₃) 1750 (shoulder, ketone C==O), 1740 (lactone), 1660 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃) δ 2.2 (m, 2, CHCH₂CH₂), 2.93 (t, 2, J = 7 Hz, CH₂CO), 3.30 (s, 3, OCH₃), 3.88 (t, 2, J = 7 Hz, CH₂OCH₃), 3.87 (m, 1, CHCH₂), 4.30 (t, 2, J = 7 Hz, CH₂N), 5.33 (AB q, 2, J = 5 Hz, ArCH₂O), 6.70 (s, 1, aromatic). Anal. (C₁₄H₁₅NO₅) m/e 277.096.

5-Methoxy-2-nitrobenzaldehyde Ethylene Acetal. A mixture of 5-methoxy-2-nitrobenzaldehyde (1.0 g, 5.5 mmol), ethylene glycol (2 mL), and p-toluenesulfonic acid (25 mg) in toluene (100 mL) was refluxed for 6 h using a Dean-Stark trap. The toluene solution was washed twice with H₂O, dried (Na₂SO₄), and evaporated in vacuo to give a brown oil (1.15 g, 92%). Although homogeneous by TLC, attempted crystallization of the acetal was unsuccessful: ¹H NMR (CDCl₃) & 3.88 (s, OCH₃), 4.02 (s, 4, OCH₂CH₂O), 6.45 (s, 1, ArCH), 6.7-8 (m, 3, aromatic). Anal. (C₁₀H₁₁NO₅) m/e 225.064.

d1-20-Deoxycamptothecin (16). A solution of N-(o-aminobenzylidene)-p-toluidine¹⁶ (154 mg, 0.733 mmol) and tricyclic ketone 15a (150 mg, 0.607 mmol) in toluene (9 mL) was refluxed using a Dean-Stark trap for 30 min. p-Toluenesulfonic acid (2 mg) was then added and refluxing was continued for an additional 3 h. The solvent was removed in vacuo and the residue chromatographed (SiO₂, 2% MeOH-CHCl₃) to give a yellow solid (159 mg, 79%), which was crystallized from CHCl₃-MeOH-Et₂O): mp 258-263 °C (lit.¹⁶ 258-264 °C).

dl-Camptothecin (17). Oxygen was bubbled through a solution of 20-deoxycamptothecin (16; 53 mg, 0.16 mmol), cupric chloride (54 mg, 0.32 mmol), and 40% aqueous dimethylamine (30 μ L) in DMF (10 mL) until TLC [SiO₂; CHCl₃-acetone-MeOH (70:20:10)] showed all of the starting material had been consumed (ca. 20 h). The solvent was removed in vacuo and the residue was chromatographed (SiO₂, 5% MeOH-CHCl₃) to give a yellow solid (48 mg), which was further purified by crystallization from 13% MeOH-CHCl₃ and EtOAc (23 mg, 41%). This material was shown to be identical with an authentic sample of natural 17 by NMR, IR, and TLC, mp 275-277 °C (lit.¹⁶ 276-278 °C).

5-Methoxy-2-aminobenzaldehyde Ethylene Acetal (18). A solution of the preceding nitro acetal (1.00 g, 4.44 mmol) and technical grade (60%) sodium sulfide (2.13 g, 8.88 mmol) in ethanol (10 mL) and H₂O (2 mL) was refluxed for 30 min. Most of the solvent was removed in vacuo and the reaction mixture was diluted with H₂O (10 mL). The aqueous phase was extracted with CH₂Cl₂ (3 × 30 mL), dried (Na₂SO₄), and evaporated to yield a light colored oil (0.77 g, 89%). Although homogeneous by TLC, attempted crystallization of 18 was unsuccessful: IR ν_{max} (CHCl₃) 3440, 3360 cm⁻¹ (NH₂); ¹H NMR (CDCl₃) δ 3.67 (s, 4, OCH₂CH₂O), 3.98 (s, 3, OCH₃), 5.73 (s, 1, ArCH), 6.2–7.3 (m, 3, aromatic). Anal. (C₁₀H₁₃NO₃) m/e 195.090.

dl-10-Methoxy-20-deoxycamptothecin (19). A solution of amino acetal 18 (300 mg, 1.54 mmol) and tricyclic ketone 15a (256 mg, 1.04 mmol) in toluene (40 mL) was refluxed using a Dean– Stark trap for 30 min. p-Toluenesulfonic acid (10 mg) was then added and refluxing was continued for an additional 2.5 h. The solvent was removed in vacuo and the residue chromatographed (SiO₂, 0.5% MeOH-CHCl₃) to give a yellow solid (318 mg, 85%), which was crystallized from CHCl₃-EtOAc, mp 266–267 °C (lit.¹⁷ 264–265 °C).

d1-10-Methoxycamptothecin (20). Oxygen was bubbled through a solution of 10-methoxy-20-deoxycamptothecin (19; 60 mg, 0.17 mmol), cupric chloride (100 mg, 0.743 mmol), and 40% aqueous dimethylamine (30 μ L) in DMF (10 mL) until TLC [SiO₂; CHCl₃-acetone-MeOH (70:20:10)] showed all of the starting material had been consumed (ca. 20 h). The solvent was removed in vacuo and the residue passed through a clean-up column (SiO₂, 5% MeOH-CHCl₃). Further chromatography (SiO₂; 0.5% MeOH-CHCl₃). Further chromatography (SiO₂; 0.5% MeOH-CHCl₃) fthis material gave a yellow solid (38 mg, 61%), which was crystallized from 13% MeOH-CHCl₃ and EtOAc. This material was shown to be identical with an authentic sample of natural 15 by NMR, IR, and TLC, mp 268-270 °C (lit.¹⁷ 271-272 °C).

dl-10-Hydroxycamptothecin (21). dl-10-Methoxycamptothecin (20; 30 mg, 0.079 mmol) was refluxed in 48% HBr (2 mL) for 1.5 h. The solvent was removed in vacuo and the residue chromatographed (silica gel 60, 2% MeOH-CHCl₃) to yield a yellow solid (14 mg, 48%), which was crystallized from 13% MeOH-CHCl₃ and EtOAc. This material was identical with an authentic sample of natural 10-hydroxy-20(S)-camptothecin by NMR, IR, and TLC, mp 265-268 °C (lit.¹⁷ 263-264 °C).

10-[(Carbethoxymethyl)oxy]-20(S)-camptothecin (22). A suspension of 10-hydroxy-20(S)-camptothecin (3; 201 mg, 0.552 mmol), powdered K₂CO₃ (350 mg, 2.54 mmol), and ethyl bromoacetate (900 mg, 5.39 mmol) in anhydrous acetone (50 mL) was refluxed for 5 h. The reaction was monitored by TLC [SiO₂, CHCl₃-acetone-MeOH (75:20:5)] for the disappearance of starting material. The solvent was removed in vacuo and the residue acidified to pH 5-6 with 1 N HCl. The aqueous solution was extracted with CH2Cl2, dried (Na2SO4), and evaporated to leave a solid, which was chromatographed (silica gel 60, 1% MeOH-CHCl₃) to yield a yellow solid (154 mg, 62%). Crystallization from CHCl₃ w yield a year work (at r m_g) c_{1} (c_{1} m c_{2} CHCl₃-EtOAc gave an analytical sample: mp 248-251 °C; IR ν_{max} (KBr) 1750 (shoulder, ester C=O), 1740 (lactone), 1660 cm⁻ (pyridinone); ¹H NMR (CDCl₃-CD₃OD) δ 1.00 (t, 3, J = 7.5 Hz, CH_2CH_3 , 1.31 (t, 3, J = 7 Hz, OCH_2CH_3), 1.90 (q, 2, J = 7.5 Hz, CH_2CH_3), 4.30 (q, 2, J = 7 Hz, OCH_2), 4.77 (s, 2, OCH_2CO_2Et), 5.21 (s, 2, ArCH₂N), 5.41 (AB q, 2, J = 8 Hz, ArCH₂O), 7.0-8.5 (m, 5, aromatic). Anal. $(C_{21}H_{22}N_2O_7)$ C, H, N.

10-[(Carboxymethyl)oxy]-20(S)-camptothecin (23). A solution of ester 22 (70 mg, 0.156 mmol) and K_2CO_3 (87 mg, 0.63 mmol) in EtOH (4 mL) and H_2O (4 mL) was stirred at room temperature for 4 h, at which time TLC [SiO₂, CHCl₃-acetone-MeOH (75:20:5)] showed the presence of only trace amounts of starting material. The volume of the reaction mixture was reduced to approximately 0.5 mL. It was then transferred to a centrifuge tube and acidified to pH 2-3 with 1 N HCl. After the mixture was centrifuged, the supernatant was decanted, more H₂O was added to the yellow precipitate, and the process repeated twice more. The remaining H₂O was removed in vacuo, and the residue was dissolved in 13% MeOH-CHCl₃, filtered, and evaporated to yield a yellow solid (62.5 mg, 95%): mp 210-230 °C dec; IR ν_{max} (KBr) 1740 (br with shoulders, lactone and carboxylic acid), 1655

cm⁻¹ (pyridindone); ¹H NMR (Me₂SO- d_6) δ 0.89 (t, 3, J = 7 Hz, CH₂CH₃), 1.83 (m, 2, CH₂CH₃), 4.85 (s, 2, OCH₂CO₂H), 5.18 (s, 2, ArCH₂N), 5.38 (s, 2, ArCH₂O), 7.2–8.6 (m, 5, aromatic). Anal. (C₂₂H₁₈N₂O₇) C, H, N.

Sodium Salt of 10-[(Carboxymethyl)oxy]-20(S)-camptothecin (24). Carboxylic acid **23** (62.5 mg, 0.148 mmol) was suspended in MeOH (4 mL) and NaHCO₃ (12.4 mg, 0.148 mmol) in H₂O (1 mL) was added. The acid dissolved almost instantaneously. The solvent was removed in vacuo, and the residue was taken up in water (3 mL) and washed once with CH₂Cl₂. The aqueous solution was lyophilized to yield a yellow solid (62.7 mg, 95%): mp gradual dec; IR ν_{max} (KBr) 1740 (lactone), 1660 cm⁻¹ (pyridinone); ¹H NMR (Me₂SO-d₆) δ 0.87 (t, 3, J = 6 Hz, CH₂CH₃), 1.83 (m, 2, CH₂CH₃), 4.34 (s, 2, OCH₂CO₂Na), 5.16 (m, 2, ArCH₂N), 5.38 (s, 2, ArCH₂O), 7.1–8.5 (m, 5, aromatic). Anal. (C₂₂H₁₇-N₂O₇Na·H₂O) C, H, N.

10-[2'-(Diethylamino)ethoxy]-20(S)-camptothecin (25). A suspension of 10-hydroxy-20(S)-camptothecin (3; 100 mg, 0.275 mmol), 2-(diethylamino)ethyl chloride hydrochloride (77 mg, 0.448 mmol), and anhydrous K₂CO₃ (190 mg, 1.38 mmol) in dry DMF (2.5 mL) was stirred at 50 °C for 1 h. TLC [SiO₂, CHCl₃-acetone-MeOH (75:20:5)] showed no starting material. The solvent was removed in vacuo, and the residue was taken up in MeOH-CHCl₃, filtered, and chromatographed (silica gel 60, 20% MeOH-CHCl₃) to give a yellow solid (107 mg, 84%): mp 206-208 °C; IR ν_{max} (KBr) 1745 (lactone), 1655 cm⁻¹ (pyridinone); ¹H NMR (CDCl₃-CD₃OD) δ 1.01 (t, 3, J = 6 Hz, CH₂CH₃), 1.11 (t, 6, J = 8 Hz, NCH₂CH₃), 1.94 (m, 2, CH₂CH₃), 2.72 (q, 4, J = 7 Hz, NCH₂CH₃), 3.0 (t, 2, J = 6 Hz, ArCH₂O), 7.2–8.4 (m, 5, aromatic). Anal. (C₂₆H₂₉N₃O₅·H₂O) C, H, N.

10-[2'-(Diethylamino)ethoxy]-20(S)-camptothecin Hydrochloride (26). The compound 25 (54 mg, 0.117 mmol) was dissolved in a mixture of absolute ethanol (4 mL) and chloroform (1 mL). The solution was cooled in a dry ice-CCl₄ bath and HCl gas was bubbled through the solution at a moderate rate for several minutes before flushing the system with a stream of N₂. The hydrochloride was precipitated by dilution with ether (10 mL), and the precipitate was filtered and dried under N₂ to yield 26 (58 mg, 100%): mp 167-174 °C; IR ν_{max} (KBr) 1745 (lactone), 1655 (pyridinone), 1620 and 1595 cm⁻¹ (aromatic). Anal. (C₂₆-H₂₉N₃O₅-HCl·1.5H₂O) C, H, N.

dl-12-Aza-20-deoxycamptothecin (28). Tricyclic ketone 15a (222 mg, 0.899 mmol) and 2-amino-3-formylpyridine¹⁸ (121 mg, 1.00 mmol) were heated neat at 100 °C for 2 h. The residue was chromatographed (silica gel 60, 2% MeOH–CHCl₃) to give a solid, which was crystallized from CHCl₃–EtOAc to yield 28 (156 mg, 52%): mp 280–285 °C dec; IR ν_{max} (KBr) 1740 (lactone), 1655 cm⁻¹ (pyridinone); ¹H NMR (TFA-d₁) δ 1.17 (t, 3, J = 7 Hz, CH₂CH₃), 2.23 (m, 2, CHCH₂CH₃), 3.97 (m, 1, CHCH₂), 5.67 (s, 2, ArCH₂O or CH₂N), 5.70 (s, 2, ArCH₂O or ArCH₂N) 7.7–9.6 (m, 5, aromatic). Anal. (C₁₉H₁₅N₃O₃) C, H, N.

dl-12-Azacamptothecin (29). Through a solution of 28 (103 mg, 0.309 mmol), cupric nitrate trihydrate (284 mg, 1.18 mmol), and 25% aqueous dimethylamine (80 μ L) in DMF (25 mL) was bubbled oxygen for approximately 1 h. The reaction was monitored by TLC [silica gel, CHCl₃-acetone-MeOH (70:20:10)]. The solvent was removed in vacuo and the residue chromatographed on a short silica gel 60 column (10% MeOH-CHCl₃). The residue was taken up in a large amount of CH_2Cl_2 and washed with H_2O ; the CH_2Cl_2 extract was dried (Na₂SO₄) and evaporated to yield a yellow solid, which was further purified by chromatography (silica gel 60, 5% MeOH-CHCl₃) and crystallized from 13%MeOH-CHCl₃ and EtOAc to yield 29 (26 mg, 24%): mp 300-305 °C dec; IR ν_{max} (KBr) 1740 (lactone), 1655 cm⁻¹ (pyridinone); ¹H NMR (TFA- d_1) δ 1.15 (t, 3, J = 7 Hz, CH₂CH₃), 2.18 (q, 2, J =7 Hz, CH_2CH_3), 5.76 (AB q, 2, J = 17 Hz, $ArCH_2O$), 5.79 (s, 2, CH₂N), 8-9.5 (m, 5, aromatic). Anal. (C₁₉H₁₅N₃O₄) C, H, N.

3-Nitro-2-naphthalenemethanol (31). A solution of diborane in THF (38 mL, 0.98 M, 37.2 mmol) was added dropwise to a solution of 3-nitro-2-naphthoic acid¹⁹ (30; 2.72 g, 12.6 mmol) in anhydrous THF (15 mL). The solution was allowed to stir overnight at room temperature. The reaction was quenched with 50% aqueous THF (20 mL), and K₂CO₃ was added until the two phases separated. The aqueous layer was extracted with Et₂O (30 mL). The combined organic layers were dried (MgSO₄), filtered, and evaporated to yield a solid, which was crystallized from CHCl₃-hexane to give 31 (2.42 g, 95%): mp 123–124 °C; ¹H NMR (CDCl₃-CD₃OD) δ 5.10 (s, 2, ArCH₂O), 7.3–8.8 (m. 6, aromatic). Anal. (C₁₁H₉NO₃) C, H, N.

3-Nitro-2-naphthaldehyde (32). MnO_2 (5 g, 57.5 mmol) was added to a solution of 31 (2.74 g, 13.5 mmol) in CHCl₃ (60 mL), and the solution was stirred at room temperature for 3 h. Additional MnO_2 was added in 5-g portions every 3 h until TLC (SiO₂, 5% MeOH-CHCl₃) showed the reaction was complete (a total of 25 g of MnO_2 was used). The reaction mixture was filtered and the solvent evaporated to give a brown solid, which was crystallized from CHCl₃-hexane to give 32 (1.80 g, 66%): mp 124 °C; IR ν_{max} (CHCl₃) 1695 cm⁻¹ (aldehyde C==O); ¹H NMR (CDCl₃) δ 7.4-8.8 (m, 6, aromatic), 10.50 (s, 1, CHO). Anal. (C₁₁H₇NO₃) C, H, N.

3-Nitro-2-naphthaldehyde Ethylene Acetal (33). A solution of 32 (1.75 g, 8.71 mmol), ethylene glycol (3.5 mL), and *p*-toluenesulfonic acid (20 mg) in toluene (100 mL) was refluxed in a Dean-Stark apparatus for 4 h. The solvent was removed in vacuo and the residue taken up in CH₂Cl₂ (100 mL), washed with H₂O (2 × 100 mL), dried (Na₂SO₄), and evaporated to give a brown solid, which was crystallized from CHCl₃-hexane to give 33 (2.08 g, 97%): mp 112-114 °C; ¹H NMR (CDCl₃) δ 6.68 (s, 1. ArCH), 7.4–8.8 (m, 6, aromatic). Anal. (C₁₃H₁₁NO₄) C, H, N.

3-Amino-2-naphthaldehyde Ethylene Acetal (34). A solution of 33 (300 mg, 1.22 mmol) in ethanol (30 mL) was shaken in a Paar shaker in the presence of PtO₂ (200 mg) for 15 min at room temperature under hydrogen (40 psi). The reaction mixture was filtered and the solvent removed in vacuo to give an oil (236 mg, 100%), which was homogeneous by TLC: ¹H NMR (CDCl₃) δ 5.90 (s, 1, ArCH), 6.8–7.9 (m, 6, aromatic). Anal. (C₁₃H₁₃NO₂) m/e 215.095.

dl-Benz[j]deoxycamptothecin (35). A solution of 34 (238 mg, 1.11 mmol) and the tricyclic ketone 15a (211 mg, 0.854 mmol) in anhydrous toluene (50 mL) was refluxed for 30 min in a Dean-Stark apparatus. p-Toluenesulfonic acid (10 mg) was then added and the reaction mixture was refluxed for 3 h. The solvent was removed in vacuo and the residue chromatographed (silica gel, 2% MeOH-CHCl₃) to give a yellow solid, which was crystallized from 13% MeOH-CHCl₃ to give 35 (148 mg, 41%): mp 306 °C dec; IR v_{max} (KBr) 1735 (lactone), 1660 cm⁻¹ (pyridinone); ¹H NMR (TFA-d₁) δ 1.19 (t, 3. J = 7 Hz, CH₂CH₃), 2.26 (m, 2, CH₂CH₃). 4.04 (m, 1, ArCH). 5.72 (AB q, 2, J = 18 Hz, ArCH₂O), 5.82 (s, 2, CH₂N). 7.8-9.6 (m, 8, aromatic). Anal. (C₂₄H₁₈N₂O₃) C. H, N.

dl-Benz[j]camptothecin (36). Oxygen was bubbled through a solution of 35 (280 mg, 0.733 mmol), cupric acetate (150 mg).

and 25% aqueous dimethylamine (1.5 mL) in DMF (150 mL) until TLC [SiO₂, MeOH-acetone-CHCl₃ (5:20:75)] showed the disappearance of starting material (approximately 2 h). The solvent was removed in vacuo and the residue chromatographed (silica gel 60, 4% MeOH-CHCl₃) to give a yellow solid, which was crystallized from 13% MeOH-CHCl₃ and then HOAc to yield yellow needles (68 mg, 23%): mp 285 °C dec; IR ν_{max} (KBr) 1740 (lactone), 1655 cm⁻¹ (pyridinone); ¹H NMR (TFA-d₁) δ 1.14 (t, 3, J = 7 Hz, CH₂CH₃), 2.16 (m, 2, CH₂CH₃), 5.71 (AB q, 2, J = 16 Hz, ArCH₂O), 5.81 (s, 2, CH₂N), 7.8–9.6 (m, 8, aromatic). Anal. (C₂₄H₁₈N₂O₄·0.5H₂O) C, H, N.

18-Methoxydeoxycamptothecin (37). A solution of ketone 15b (459 mg, 1.66 mmol) and N-(o-aminobenzylidene)-p-toluidine¹⁶ (419 mg, 2.00 mmol) in toluene (40 mL) was refluxed for 30 min. The inixture was cooled, p-toluenesulfonic acid (5 mg) was added, and then the mixture was refluxed for an additional 3 h. The solvent was removed in vacuo and the residue chromatographed (silica gel 60, 0.5% MeOH-CHCl₃) to give a solid, which was crystallized from CHCl₃-EtOAc to yield 37 (477 mg, 79%): mp 260-261 °C; IR ν_{max} (CHCl₃), 1740 (lactone), 1660 cm⁻¹ (pyridinone); ^tH NMR (CDCl₃-CD₃OD) δ 2.36 (m, 2, CHCH₂CH₂), 3.31 (s. 3, OCH₃), 3.50 (t, 2, J = 6 Hz, CH₂OCH₃), 3.90 (m, 1, CHCH₂), 5.28 (s, 2, CH₂N), 5.44 (AB q, 2, J = 6 Hz, ArCH₂O), 7.3-8.4 (m, 6, aromatic). Anal. (C₂₁H₁₈N₂O₄) C, H, N.

d1-18-Methoxycamptothecin (38). Oxygen was bubbled through a solution of deoxycamptothecin (37; 90 mg, 0.249 mmol), cupric nitrate trihydrate (230 mg, 0.954 mmol), and 25% aqueous dimethylamine (65 μ L) in DMF (20 mL) until no more starting material remained (approximately 1 h). The reaction was monitored by TLC [silica gel, CHCl₃-acetone-methanol (70:20:10)]. The solvent was removed in vacuo, and the residue was taken up in CH₂Cl₂ and washed with H₂O. The organic phase was dried (Na₂SO₄) and evaporated to yield a solid, which was chromatographed (silica gel 60, 1% MeOH-CHCl₃) to give a yellow product which was crystallized from CHCl₃ to yield 38 (47 mg, 50%): mp 244-245 °C; IR ν_{max} (KBr) 1740 (lactone), 1655 (pyridinone) cm⁻¹; ¹H NMR (CDCl₃-CD₃OD) δ 2.16 (m, 2, CHCH₂CH₂), 3.36 (s, 3, OCH₃). 3.56 (m, 2, CH₂OCH₃), 5.24 (s, 2, CH₂N), 5.44 (AB q, 2, J = 16 Hz, ArCH₂O), 7.5-8.5 (m, 6, aromatic). Anal. (C₂₁H₁₈N₂O₅) C, H, N.

The time course of the tissue accumulation of 16 neutral, cationic, and anionic drugs by resting and 2-Hz stimulated atria of the guinea pig was measured. The accumulation of the substances was quantified by means of their tissue to medium ratios (T/M). Auricles driven with 2 Hz accumulated the drugs faster and during a long period of time to a greater extent than resting atria. By extrapolation of the binding characteristics, the final equilibrium T/M values were estimated. The variance in these accumulation data at equilibrium $(\log T/M)$ could be best described by a linear combination of log P (octanol/water) and the ability of the drugs to bind to atrial homogenate (log percent bound/percent free). A parameter calculated from protein binding appeared less significant. Comparable results were obtained for the accumulation of drugs into atrial tissue is determined by the facility of their penetration of the plasma membrane and the extent of their intracellular binding.

Uptake studies of drugs by tissues on which they exert their pharmacological effect have frequently been made. These experiments have usually been designed to obtain information on the affinity of drugs for their receptors in the effector organ. Many of these investigations were hampered by a considerable degree of accumulation, which cannot be satisfactorily related to the amount of drug bound by the receptors. The rate of binding of atropine, for instance, appeared to be much slower than the rate of the antagonistic action.²⁻⁴ At equilibrium only a fraction
