pyridine hydrochloride were formed, and the supernatant had a light brown color. The reaction mixture was poured on ice-water and stirred for a few minutes. The milky solution was extracted with ether. The organic layer was washed with dilute HCl to remove the pyridine. The ether was evaporated at room temperature. The residue was dissolved in methanol and left for crystallization to give a product yield of $9.0 \mathrm{~g}(65 \%), \mathrm{mp} 49-50$ ${ }^{\circ} \mathrm{C}$.

1-(3,4-Dimethoxyphenyl)-2-(methylseleno)ethane (3). To dimethyl diselenide ( $2.23 \mathrm{~g}, 12 \mathrm{mmol}$ ) in THF, under nitrogen, sodium borohydride ( $1.9 \mathrm{~g}, 24 \mathrm{mmol}$ ) in ethanol was added dropwise until the solution decolorized. To this solution was added the tosyl derivative $2(6.72 \mathrm{~g}, 20 \mathrm{mmol})$ in ethanol. After 30 min of stirring, water was added to the reaction mixture, and the mixture was extraced with chloroform. The organic layer was washed with water, dried over anhydrous magnesium sulfate, and evaporated to leave $4 \mathrm{~g}(77 \%)$ of a pale yellow oil: NMR $\left(\mathrm{CDCl}_{3}\right)$ $\delta 6.73-6.83(\mathrm{~m}, 3 \mathrm{H}, \mathrm{ArH}), 3.87\left(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{OCH}_{3}\right.$ ), 2.76-2.93 (m, $4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), $2.00\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right.$ ).
[2-(3,4-Dimethoxyphenyl)ethyl]dimethylselenonium Iodide (4). Methyl iodide ( $1.45 \mathrm{~g}, 10 \mathrm{mmol}$ ) was added to compound $3(2.59 \mathrm{~g}, 10 \mathrm{mmol})$ and left at room temperature for 30 min . The yellow solid that formed was dissolved in absolute ethanol and left for crystallization. Yellow crystals ( $3 \mathrm{~g}, 75 \%$ ) of the desired compound were obtained: $\mathrm{mp} 113-115{ }^{\circ} \mathrm{C}$; $\mathrm{NMR}\left(\mathrm{D}_{2} \mathrm{O}\right) \delta 6.95-7.05$ $(\mathrm{m}, 3 \mathrm{H}, \mathrm{ArH}), 3.90\left(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{OCH}_{3}\right), 3.56-3.80\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{Ph}-\mathrm{CH}_{2}\right)$, $3.03-3.30\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Se}\right), 2.67\left(\mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right.$ ); MS, $m / e 260(\mathrm{M}$ for the cation - $\mathrm{CH}_{3}$ ). Anal. ( $\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{O}_{2} \mathrm{SeI}$ ) $\mathrm{C}, \mathrm{H}$.
[2-(3,4-Dihydroxyphenyl)ethyl]dimethylselenonium Chloride (7). The selenide $3(4 \mathrm{~g}, 16 \mathrm{mmol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The solution was filtered and transferred to a three-necked flask equipped with a condenser and dropping funnel. The system was placed under nitrogen and cooled to $0^{\circ} \mathrm{C}$. Boron trichloride ( 35 mL of 1 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 35 \mathrm{mmol}$ ) was added. After the addition, the solution was allowed to warm to room temperature and stirred overnight. The reaction was quenched with methanol ( 50 mL ), and the solvent was removed under vacuo to leave a white solid. Crystallization from methanol/acetone provided shiny crystals of compound $7(3.5 \mathrm{~g}, 77 \%)$ : mp 148-149 ${ }^{\circ} \mathrm{C}$; NMR ( $\left.\mathrm{D}_{2} \mathrm{O}\right) ~ \delta$ 6.85-7.02 (m, $3 \mathrm{H}, \mathrm{ArH}$ ), 3.45-3.76 (t, $2 \mathrm{H}, \mathrm{Ph}-\mathrm{CH}_{2}$ ), 2.91-3.23 $\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Se}\right), 2.67\left[\mathrm{~s}, 6 \mathrm{H}, \mathrm{Se}\left(\mathrm{CH}_{3}\right)\right] ; \mathrm{MS}, m / e(\mathrm{M}$ for cation $-\mathrm{CH}_{3}$ ). Anal. $\left(\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{2} \mathrm{SeCl}\right) \mathrm{C}, \mathrm{H}$.

Radioactive Synthesis. To selenious acid ( $1.29 \mathrm{mg}, 10 \mu \mathrm{~mol}$ ) in 0.1 mL of phosphate buffer ( $\mathrm{pH} 6.0,0.5 \mathrm{M}$ ), 3.5 mCi of $\mathrm{H}_{2}{ }^{75} \mathrm{SeO}_{3}$ was added. The solution was stirred under argon, and sodium borohydride ( $1.14 \mathrm{mg}, 30 \mu \mathrm{~mol}$ ) in 0.1 mL water was added dropwise until a colorless solution was formed. To this solution, 0.2 mL of phosphate buffer ( $\mathrm{pH} 6.0,0.5 \mathrm{M}$ ) was added, followed by the addition of the tosyl derivative $2(3.36 \mathrm{mg}, 10 \mu \mathrm{~mol})$ in 0.1 mL ethanol. Ethanol ( 0.5 mL ) was added to the reaction mixture and stirred overnight. Then the mixture was extracted with ether, and the organic layer was left to evaporate at room temperature. The residue, diselenide 9 ( 3 mCi ), in 0.2 mL of THF was transferred to a three-necked flask, and $\mathrm{NaBH}_{4}(0.38 \mathrm{mg}, 10 \mu \mathrm{~mol})$ in 0.2 mL of $95 \%$ ethanol was added under argon, followed by the addition of $\mathrm{CH}_{3} \mathrm{I}(2.9 \mathrm{mg}, 20 \mu \mathrm{~mol})$. After the solution was stirred for $15 \mathrm{~min}, 2 \mathrm{~mL}$ of water was added, and the solution was extraced with ether. The aqueous layer contained compound $4(1.1 \mathrm{mCi})$, while the ether layer contained compound $3(1.8 \mathrm{mCi})$. The ether layer was dried over anhydrous $\mathrm{MgSO}_{4}$ and filtered, and the filtrate was evaporated to dryness by using a stream of nitrogen. The residue was dissolved in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; to this solution, boron trichloride in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added under argon. After 5 h , excess $\mathrm{BCl}_{3}$ was decomposed with methanol, and 0.5 mL of water was added. The solution was extracted with ether to remove the unreacted starting material. The aqueous layer contained 1.3 mCi of the desired salt 7.

Tissue Distribution Studies. The tissue distribution of $\left[{ }^{75} \mathrm{Se}\right]$ selenonium salts 4 and 7 was examined in female Sprague-Dawley rats ( $100-300 \mathrm{~g}$ ). The rats were injected in a lateral tail vein with 0.2 mL of a saline solution containing 5-6 $\mu \mathrm{Ci}$ of test compound. At different time periods after injection, groups of rats (five animals per group) were subjected to chloroform anesthesia and killed by cardioectomy. Samples of large organs (liver, lungs, small intestine, and muscle) were taken, and small organs (heart, kidneys, spleen, uterus, and adrenals) were taken intact, rinsed with saline, blotted dry, and weighed. The radioactivity in the samples was counted in a Beckman Automatic Gamma Counter (Model 9000), and the values were converted to percent of injected dose per gram of sample ( $\%$ dose/g).

# $\beta_{1}$-Selective Adrenoceptor Antagonists: Examples of the 2-[4-[3-(Substituted-amino)-2-hydroxypropoxy]phenyl]imidazole Class 

John J. Baldwin, ${ }^{*}{ }^{\dagger}$ George H. Denny, ${ }^{\dagger}$ Ralph Hirschmann, ${ }^{\dagger}$ Mark B. Freedman, ${ }^{\dagger}$ Gerald S. Ponticello, ${ }^{*}{ }^{\dagger}$ Dennis M. Gross, ${ }^{\ddagger}$ and Charles S. Sweet ${ }^{\ddagger}$<br>Merck Sharp \& Dohme Research Laboratories and Merck Institute for Therapeutic Research, West Point, Pennsylvania 19486. Received September 30, 1982

A series of 2-[4-[3-(substituted-amino)-2-hydroxypropoxy]phenyl]imidazoles is described. The compounds were investigated in vitro for $\beta$-adrenoceptor antagonism, and several examples were found to be selective for the $\beta_{1}$-adrenoceptor. The structure-activity relationship exhibited by this series of compounds is discussed. (S)-2[ $p$-[3-[[2-(3,4-dimethoxyphenyl)ethyl]amino]-2-hydroxypropoxy]phenyl]-4-(2-thienyl)imidazole [(S)-13] was over 100 times more selective than atenolol for the $\beta_{1}$-adrenergic receptor and has been selected for in-depth studies.

A substantial advance in the understanding of the adrenergic system occurred in 1948, when Ahlquist ${ }^{1}$ proposed the existence of two discrete receptor types designated $\alpha$ and $\beta$. The introduction of pronethalol ${ }^{2}$ and propranolol ${ }^{3}$ reinforced this hypothesis and laid the foundation for the role of $\beta$-adrenoceptor antagonists in the management of various cardiovascular conditions, particularly angina pectoris, cardiac arrhythmias, and essential hypertension. ${ }^{4}$

[^0]However, the use of such agents is occasionally associated with bronchospasms and Raynaud's phenomenon. An approach toward elimination of these side effects emerged with the discovery of practolol, ${ }^{5}$ a cardioselective agent,

Scheme I

which discriminated between the cardiac $\beta_{1^{-}}$and peripheral $\beta_{2}$-adrenoceptors. Although cardioselective agents, such as metoprolol, atenolol, and betaxolol, have been developed, they exhibit only modest separation between these subreceptor affinities (see Table II).

In this paper, we describe $\beta_{1}$-adrenoceptor antagonists in which the in vitro $\beta_{1}$-selectivity, for all practical purposes, borders on absolute specificity. In principal, such highly selective compounds should offer significant therapeutic advantages. Our specific approach in the design of such agents took advantage of the cardioselectivity observed for (S)-2-[ $p$-[3-(tert-butylamino)-2-hydroxy-propoxy]phenyl]-4-(trifluoromethyl)imidazole (1a) ${ }^{6}$ and related compounds $\mathbf{1 b}-\mathbf{f}^{7}$ Specifically, the strategy centered on a two-point variation involving the imidazole 4 -substituent and the $N$-tert-butyl moiety.

Chemistry. The compounds synthesized during the course of this study are listed in Table I. Examples 1b and 1c were prepared from 2-[4-(2,3-epoxypropoxy)-phenyl]-4-(trifluoromethyl)imidazole ${ }^{6}$ on reaction with cyclopropylamine and 2-(3,4-dimethoxyphenyl)ethylamine, ${ }^{8}$ respectively (method A). Substituent variation at both $R$ and $R^{1}$ was accomplished via the synthetic strategies outlined in Schemes I and II.

$$

As shown in Scheme I (method B), the key intermediates 4a,b were prepared by two different methods. For 4a, the approach involved side-chain introduction, followed by imidazole ring construction; in the synthesis of $4 \mathbf{b}$, the reverse strategy was used, i.e., ring formation followed by incorporation of the side chain.

For the preparation of 7 and 8 from 4a, acid hydrolysis of the acetonide protecting group yielded the diol 5a. Treatment of 5a with methanesulfonyl chloride gave the primary mesylate, which, after reaction with slightly less than an equivalent amount of $\mathrm{NaOCH}_{3}$, generated the epoxide 6a. Ring opening of the epoxide $6 \mathbf{a}$ with either

cyclopropyl or 2-(3,4-dimethoxyphenyl)ethylamine provided the 4 -unsubstituted imidazoles 7 and 8 , respectively. ${ }^{9}$ The syntheses of the thienyl-substituted derivatives 9 and 10 from $4 b$ were accomplished in an analogous manner to that used for 7 and 8. Compound 9, having two chiral centers, was determined to be an equal mixture of diastereomers. Using $300-\mathrm{MHz}{ }^{1} \mathrm{H}$ NMR, the methyl signal at $\delta 1.2$ appeared as two finely split doublets.

As outlined in Scheme II, compounds 12-17 were prepared by direct introduction of the aminohydroxypropyl group through the reaction of the oxazolidine tosylate 11 with the preformed imidazoles 2 b and 2 c (method C). ${ }^{7}$ In the preparation of 12, for example, the sodium salt of 2 -(p-hydroxyphenyl)-4-(2-thienyl)imidazole (2b) was allowed to react with the tosylate of 2 -phenyl-3-cyclo-propyl-5-(hydroxymethyl)oxazolidine (11a), which, after deprotection, provided 12 . Varying the amino group of 11 and the substituent in the 4 -position of the imidazole ring provided the remaining examples 13-17.
The chiral center in ( $S$ )-8, $(S)$-13, and ( $R$ )-13 was established via the diacetonide of D-mannitol (20) (method D). ${ }^{10}$ Sequential treatment of 20 with $\mathrm{Pb}(\mathrm{OAc})_{4}$, excess 2-(3,4-dimethoxyphenyl)ethylamine, and $\mathrm{NaBH}_{4}$ and acid deprotection yielded ( $S$ )-3-[[2-(3,4-dimethoxyphenyl)-ethyl]amino]-1,2-propanediol [(S)-18b]. The glycolamine ( $S$ )-18b was converted to the tosylate ( $S$ )-11b in two steps by utilizing previously described chemistry. ${ }^{6,7}$ Reaction of the sodium salt of $p$-hydroxybenzaldehyde (2a) with $(S)$-11b, followed by deprotection, provided ( $S$ )-4-[3-[[2-(3,4-dimethoxyphenyl)ethyl]amino]-2-hydroxypropoxy]benzaldehyde (21) (method E). Compound 21 was then converted to ( $S$ )-8 via condensation with glyoxal and $\mathrm{NH}_{3}$. Similarly, reaction of either chiral oxazolidines ( $S$ )-11a or ( $S$ )-11b with 2 -( $p$-hydroxyphenyl)-4-(2-thienyl)imidazole ( $\mathbf{2 b}$ ) provided, after deprotection, the imidazoles ( $S$ )-12 and ( $S$ )-13, respectively. It should be pointed out that intermediate 11 is a mixture of diastereomers with the configuration at $\mathrm{C}-5$ of the oxazolidine ring fixed as $S$. The $R$ enantiomer of 13 was prepared by treatment of the diacetonide of D-mannitol (20) with Pb $(\mathrm{OAc})_{4}$, followed by $\mathrm{NaBH}_{4}$ reduction to give ( $S$ )-glycerol 1,2-acetonide (22). ${ }^{11} \quad$ Reaction of ( $S$ )- 22 with methanesulfonyl chloride yielded the mesylate $(R)-3$. The use of $(R)-3$ in place of 3, as described in Scheme I, allowed for the synthesis of $(R)$ - 13 containing approximately $5-10 \%$ of the $S$ enantiomer. Substitution $p$-toluenesulfonyl chloride in this sequence yielded enantiomerically pure (R)-13.

Optical purity was determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy by using the chiral shift reagent tris[3-(heptafluoro-butyryl)- $\alpha$-camporate]europium. For (S)-8, (S)-13, and $(R)-13$, assay conditions were obtained by studying the effect of addition of the lanthanide reagent on racemic material. The methoxy resonances of 8 and 13 were used as analytical signals with separation of $8-15 \mathrm{~Hz}$ for each methoxy in the presence of 0.1 and 0.5 molar equiv of lanthanide. This technique did not differentiate clearly any signals in the racemic mixture of 12 due to significant line broadening in the presence of chiral shift reagent. Thus, the chiral purity of ( $S$ )-12 is based on analogy and rotation.

[^1]Data Analysis. The data were analyzed by calculating the mean isoproterenol-induced relaxation of the tracheal chain (five to seven doses) for 6-12 tracheal chain preparations, and in the case of the atria, the mean isoproter-enol-induced chronotropic response (seven to eight doses) for eight atrial preparations were determined. This was done for the isoproterenol concentration-response in the absence of antagonist and in the presence of antagonist. The concentration-response relationship was analyzed by nonlinear symmetrical curve fitting routines to yield a calculated $\mathrm{EC}_{50}$. If only a single concentration of antagonist was being studied, the data resulting from the analysis were used to calculate a "local $\mathrm{p} A_{2}$ " as proposed by MacKay ${ }^{12}$ and applied by O'Donnell and Wanstall. ${ }^{13}$ The "local $\mathrm{p} A_{2}$ " was calculated from the following equation:

$$
\mathrm{p} A_{2}=\log [(B-A) / A] / P
$$

where $A=\mathrm{EC}_{50}$ of agonist in the absence of antagonist, $B=\mathrm{EC}_{50}$ of agonist in the presence of antagonist, and $P$ $=$ concentration of antagonist. If more than one concentration of antagonist was used in the study, the individual data were further analyzed by the method of Schild ${ }^{14}$ to produce a multiconcentration "system $\mathrm{p} A_{2}$ ". The system $\mathrm{p} A_{2}$ was calculated by unweighted linear regression analysis of the line of best fit by the method of least squares. The $\mathrm{p} A_{2}$ was the positive value of the intercept of the line derived by plotting $\log (C D-1)$ vs. $\log$ antagonist concentration with the abscissa. All computations were performed on a DEC MINC-11 computer.

## Results and Discussion

We have previously reported that the trifluoromethylimidazole derivative la lowered mean arterial blood pressure in the spontaneously hypertensive rat (SHR) and exhibited vasodilating and $\beta_{1}$-selective adrenoceptor antagonism in the dog. ${ }^{6}$.The observed selectivity was on the order of that seen with practolol (Table II). Variation of the trifluoromethyl group of 1a yielded specific examples that demonstrated enhanced $\beta_{1}$ selectivity (compounds 1d-f, Table II). ${ }^{7}$ In a separate structural study, replacement of the N -terminal tert-butyl moiety of la with cyclopropyl and 2-(3,4-dimethoxyphenyl)ethyl moieties also provided examples that exhibited high $\beta_{1}$ selectivity (compunds 1b and 1c, Table II). Therefore, our approach toward cardiospecific agents was to simultaneously incorporate those structural features that in the two single variant studies enhanced $\beta_{1}$-selectivity.

The in vitro evaluation of compounds 1, 7-10, and 12-17 is summarized in Table II. The interaction with the $\beta_{1^{-}}$ receptor was determined via inhibition of the positive chronotropic actions of isoproterenol is isolated guinea pig atrial preparations. $\beta_{2}$ potency was determined by using isolated guinea pig tracheal chains contracted with $\mathrm{PGF}_{2 \alpha}$ and by measuring inhibition of isoproterenol-induced relaxation.
In the single-point study, substitution of the trifluoromethyl group of la by hydrogen and methyl decreased both $\beta_{1}$ and $\beta_{2} \mathrm{p} A_{2}$ values with a tendency toward greater $\beta_{1}$ selectivity. Replacement of the $N$-tert-butyl group by cyclopropyl and 2-(3,4-dimethoxyphenyl)ethyl moieties induced a negative effect primarily on $\beta_{2}$ antagonism, thus providing a greater increase in $\beta_{1}$ selectivity.

Variation of both the 4-trifluoromethyl group with hydrogen and methyl and the $N$-tert-butyl substituent with

(14) Arualakshana, O.; Schild, H. O Br. J. Pharmacol. 1959, 14, 48.
cyclopropyl and 2-(3,4-dimethoxyphenyl)ethyl moieties resulted in a further increase in the cardioselectivity ratio. For example, compounds 7, 8, 16, and 17 exhibited a separation between $\beta_{1}$ and $\beta_{2}$ affinities of 2.5 to $3.5 \log$ units higher than that observed for 1a. In these examples, the preference for the $\beta_{1}$ - and $\beta_{2}$-receptors appeared to be reduced from that observed for the trifluoromethyl series. This reduction in potency was much more pronounced for the $\beta_{2}$-receptor $\mathrm{p} A_{2}$ value.

In a similar SAR study for the 4 -(2-thienyl) derivatives 1f, 12 and $13 \beta_{1}$ potency was not reduced by variation of the $N$-tert-butyl substituent but remained on the order of that observed for the 4-(trifluoromethyl)imidazole 1a. However, the $\beta_{2} \mathrm{p} A_{2}$ values were depressed. The most interesting feature of this subclass was the approach toward absolute specificity for the $\beta_{1}$-receptor with the 2-(3,4-dimethoxyphenyl)ethyl derivative 13. This effect was primarily due to a decreased $\mathrm{p} A_{2}$ value for the $\beta_{2}$-receptor.

Several reports on known $\beta$-adrenoceptor antagonist ${ }^{15-17}$ have demonstrated that the $S$ enantiomers are more efficient at inhibiting the effects of isoproterenol stimulation. For this reason, the $S$ isomers of 1b, 8, 12, and 13 were prepared and evaluated. In this study (Table II), the $S$ enantiomers exhibited similar $\mathrm{p} A_{2}$ values comparable to the corresponding racemates. A more accurate system $\mathrm{p} A_{2}$ via Schild plot was determined for ( $S$ )-13; a cardioselectivity ratio of 8709 was computed. In the Schild plot, the slope for the regression function was less than 1 . However, the $95 \%$ confidence limits for the slope encompass 1 , indicating competitive antagonism. The deviation from 1 occurred with concentration ratios above 20; at lower concentrations, the deviation was less pronounced. This property of the compound may be related to its unusually high lipid solubility. For these reasons, it is not yet possible to state unequivocally that the antagonism observed is competitive. For comparison, $(R)-13$ was also synthesized and studied. In this example, both $\beta_{1}$ and $\beta_{2} \mathrm{p} A_{2}$ values for $(R)-13$ were markedly reduced from that observed for 13 and (S)-13.

In the 4-(2-thienyl)imidazole series, the introduction of $\alpha$-methyl substituents on the 2-phenylethyl side chain of 13, as in examples 9 and 10 , resulted in compounds exhibiting high cardioselectivity. Replacement of the 2-(3,4-dimethoxyphenyl)ethyl group of 13 by cyclopropyl and isopropyl (examples 12 and 14) increased affinity for the $\beta_{2}$-receptor,, with a resulting loss in cardioselectivity. Finally, removal of the 3,4-dimethoxy substituents of 13 provided compound 15 , which exhibited a diminution in the $\beta_{1} \mathrm{p} A_{2}$ value without a concomitant loss in affinity for the $\beta_{2}$-receptor. Thus, the 3,4-dimethoxy groups of 13 appear critical for $\beta_{1}$-receptor affinity. In a similar endgroup study in the 1-amino-3-( $m$-tolyloxy)-2-propanol series, ${ }^{8}$ this variation had no apparent effect on $\beta_{1}$ and $\beta_{2}$ potency as measured in vitro with atria and trachea from guinea pig against isoproterenol stimulation.

Compound ( $S$ )-13 has been chosen for in-depth evaluation. The results of these studies will be published elsewhere.

## Experimental Section

${ }^{1} \mathrm{H}$ NMR spectra were determined in the indicated solvent on a Varian T-60 or an EM390 spectrometer with tetramethylsilane as an internal standard. Optical rotation measurements were obtained on a Perkin-Elmer 141 polarimeter. Melting points were determined on a Thomas-Hoover apparatus, in open capillary tubes, and are uncorrected. Microanalyses are within $0.4 \%$ of

${ }^{a} \beta_{1} \mathrm{p} A_{2}$ values were determined with guinea pig atria that have an enriched population of $\beta_{1}$-receptors. ${ }^{b} \beta_{2}$ p $A_{2}$ values were determined with guinea pig trachea that have an enriched population of $\beta_{2} \cdot$ receptors.
$\mathbf{9 5 \%}$ confidence limits in parentheses.
theoretical values when indicated by symbols of the elements. Silica gel 60 (E. Merck, Darmstadt) was used for column chromatography. Organic solutions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered, and the filtrates were concentrated to dryness on a Buchi rotary evaporator under water-aspirator pressure ( 20 mm ).

Method A. The synthesis of $1 \mathbf{b}$ is presented as an example of the synthetic method. Compound 1 c was prepared by using essentially the same procedure by substituting 2 -( 3,4 -dimethoxyphenyl)ethylamine for cyclopropylamine.
2-[4-[3-(Cyclopropylamino)-2-hydroxypropoxy]phenyl]-4-(trifluoromethyl)imidazole (1b). A solution of 2-[4-(2,3-epoxypropoxy)phenyl]-4-(trifluoromethyl)imidazole ${ }^{6}(4.0 \mathrm{~g}, 0.014$ $\mathrm{mol})$ and cyclopropylamine ${ }^{18}(1.0 \mathrm{~g}, 0.018 \mathrm{~mol})$ in $\mathrm{CH}_{3} \mathrm{CN}(25 \mathrm{~mL})$ was heated at reflux for two 3 -h periods separated by 16 h at ambient temperature. The solution was then concentrated, and the residue was chromatographed on silica gel. The product was eluted with $10 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ and then recrystallized from $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{CH}_{3}-\mathrm{C}_{6} \mathrm{H}_{12}$ to yield $2.5 \mathrm{~g}(52 \%)$ of $1 \mathrm{~b}, \mathrm{mp} 163.5-165{ }^{\circ} \mathrm{C}$.

Method B. The preparation of 7 is presented as an example of the synthetic method. Compounds $8-10$ and $(R)-13$ were obtained by essentially the same procedure. The following amines were either obtained from commercial sources or by known literature procedures: 2-(3,4-dimethoxyphenyl)ethylamine, ${ }^{18} 3$ -(3,4-dimethoxyphenyl)-2-propylamine, ${ }^{19}$ and 3-(3,4-dimethoxy-phenyl)-2-methyl-2-propylamine. ${ }^{20}$

3-[p-(2-Imidazolyl)phenoxy]-1,2-propanediol Acetonide (4a). A solution of $2 \mathrm{a}(28 \mathrm{~g}, 0.23 \mathrm{~mol})$ in DMF $(150 \mathrm{~mL})$ was added dropwise under $\mathrm{N}_{2}$ at $70^{\circ} \mathrm{C}$ to a suspension of NaH ( $60 \%$ oil dispersion, $10 \mathrm{~g}, 0.25 \mathrm{~mol}$ ) in DMF ( 50 mL ). After 15 min at 70 ${ }^{\circ} \mathrm{C}$ a solution of $3(45.5 \mathrm{~g}, 0.22 \mathrm{~mol})$ in DMF ( 50 mL ) was added dropwise. After the solution was heated on a steam bath for 18 h, $\mathrm{H}_{2} \mathrm{O}$ was added, and the solution was extracted with EtOAc (3 times). The combined extracts were washed with $\mathrm{H}_{2} \mathrm{O}$ (2 times) and saturated NaCl , dried, and filtered, and the filtrate was concentrated. The residue was treated with $\mathrm{CH}_{3} \mathrm{OH}(500 \mathrm{~mL})$, $40 \%$ glyoxal ( 100 mL ), and $28 \%$ concentrated $\mathrm{NH}_{4} \mathrm{OH}(150 \mathrm{~mL})$. After the mixture was stirred overnight at ambient temperature, the $\mathrm{CH}_{3} \mathrm{OH}$ was removed under reduced pressure, $\mathrm{H}_{2} \mathrm{O}$ was added to the residue and the solution was extracted with $\mathrm{CHCl}_{3}$ ( 4 times). The combined extracts were dried and filtered, and the filtrate was concentrated. The residue was chromatographed on silica gel, and the product was eluted with $10 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$. The product was crystallized from toluene-ligroin to yield 13 g ( $22 \%$ ) of 4a: mp $148-150{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{Me}_{2} \mathrm{SO}-d_{6}\right) \delta 1.35(6 \mathrm{H}, \mathrm{d}), 4.0$ $(5 \mathrm{H}, \mathrm{m}), 6.95(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}), 7.05(2 \mathrm{H}, \mathrm{s}), 7.8(2 \mathrm{H}, \mathrm{d}, J=$ 9 Hz ). Anal. $\left(\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{3}\right) \mathrm{C}, \mathrm{H}, \mathrm{N}$.

2-[p-[3-(Cyclopropylamino)-2-hydroxypropoxy]phenyl]imidazole Dihydrochloride (7). A solution of 4 a ( $5.9 \mathrm{~g}, 0.022$ $\mathrm{mol})$ in $3 \mathrm{~N} \mathrm{HCl}(45 \mathrm{~mL})$ and acetone ( 45 mL ) was heated at reflux. After 0.5 h , the acetone was removed under reduced pressure, and the resulting aqueous layer was basified, saturated with solid $\mathrm{K}_{2} \mathrm{CO}_{3}$, and filtered to yield $5.2 \mathrm{~g}(100 \%)$ of $5 \mathrm{a}: \mathrm{mp}$ $165.5-167{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{Me}_{2} \mathrm{SO}-d_{6}$ ) $\delta 3.5(2 \mathrm{H}, \mathrm{m}), 3.9(3 \mathrm{H}, \mathrm{m})$, $6.65(3 \mathrm{H}, \mathrm{br} \mathrm{s}$, exch $), 6.95(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}), 7.05(2 \mathrm{H}, \mathrm{s}), 7.85$ $(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}$ ).

A mixture of $5 \mathrm{a}(15.2 \mathrm{~g}, 0.065 \mathrm{~mol}), \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N} \cdot \mathrm{HCl}(8.2 \mathrm{~g}, 0.07 \mathrm{~mol})$, and $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}(125 \mathrm{~mL})$ was cooled to $0-4{ }^{\circ} \mathrm{C}$ and stirred while methanesulfonyl chloride ( $7.5 \mathrm{~g}, 0.065 \mathrm{~mol}$ ) was added dropwise over 15 min . After the addition, the mixture was stirred at ambient temperature for 1.5 h , basified with $\mathrm{K}_{2} \mathrm{CO}_{3}(9.0 \mathrm{~g}, 0.065$ $\mathrm{mol})$ in $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$, and concentrated. The residue was triturated with a solution of $\mathrm{K}_{2} \mathrm{CO}_{3}(9.0 \mathrm{~g})$ in $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ and filtered, and the filtrate was dried to yield $18.3 \mathrm{~g}(90 \%)$ of mesylate. The product was suspended in $\mathrm{CH}_{3} \mathrm{OH}(215 \mathrm{~mL})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(215 \mathrm{~mL})$, and the solution was cooled to $0-4{ }^{\circ} \mathrm{C}$ while a solution of $\mathrm{NaOCH}_{3}$ $(3.5 \mathrm{~g}, 0.065 \mathrm{~mol})$ in $\mathrm{CH}_{3} \mathrm{OH}(40 \mathrm{~mL})$ was added over 10 min . After 1.5 h at $0-4^{\circ} \mathrm{C}, \mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$ was added, and the organic layer was separated. The aqueous layer was further extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the combined organic extracts were dried and filtered, and the filtrate was concentrated to yield $10.3 \mathrm{~g}(73 \%)$ of $6 \mathrm{a}:{ }^{1} \mathrm{H}$

[^2]NMR ( $\left.\mathrm{CDCl}_{3}+\mathrm{Me}_{2} \mathrm{SO}-d_{6}\right) \delta 2.7(2 \mathrm{H}, \mathrm{m}), 3.25(1 \mathrm{H}, \mathrm{m}), 4.1(2$ $\mathrm{H}, \mathrm{m}), 6.9(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}), 7.0(2 \mathrm{H}, \mathrm{s}), 7.75(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz})$. A mixture of $6 \mathrm{a}(4.95 \mathrm{~g}, 0.023 \mathrm{~mol}$ ) in cyclopropylamine ( 50 mL ) was heated at $60^{\circ} \mathrm{C}$. After 30 h , the mixture was concentrated, and the residue was chromatographed on silica gel. The product was eluted with $10 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ saturated with $\mathrm{NH}_{3}$ to yield $1.2 \mathrm{~g}(19 \%)$ of free base 7 . The product was converted to the dihydrochloride salt with $\mathrm{EtOH}-\mathrm{HCl}$ and crystallized from $\mathrm{EtOH}-\mathrm{MeOH}-\mathrm{Et}_{2} \mathrm{O}$ to yield 7: ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{Me}_{2} \mathrm{SO}-d_{6}\right) \delta 0.9(4 \mathrm{H}$, m), $2.8(1 \mathrm{H}, \mathrm{m}), 3.2(2 \mathrm{H}, \mathrm{m}), 4.25(3 \mathrm{H}, \mathrm{m}), 7.25(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $9 \mathrm{~Hz}), 7.75(2 \mathrm{H}, \mathrm{s}), 8.35(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9 \mathrm{~Hz}), 9.5(2 \mathrm{H}, \mathrm{br}$, exch$)$.

Method C. The synthetic sequence used to prepare $2-[p-$ [3-(cyclopropylamino)-2-hydroxypropoxy]phenyl]-4-(2-thienyl)imidazole dihydrochloride (12) is presented as an example of this method. Compounds $13-17$ were obtained by essentially the same process. The use of 2-(3,4-dimethoxyphenyl)ethylamine, isopropylamine, and 2-phenylethylamine in place of cyclopropylamine yielded the oxazolidines $19 b-d$. Use of chiral oxazolidines 19 a and 19 b yielded the chiral compounds $(S)$-12 and (S)-13, respectively.

2-[p-[3-(Cyclopropylamino)-2-hydroxypropoxy]-phenyl]-4-(2-thienyl)imidazole Dihydrochloride (12). A solution of glycidol ( $50.0 \mathrm{~g}, 0.67 \mathrm{~mol}$ ) in 2-propanol was added dropwise with stirring at $45^{\circ} \mathrm{C}$ to a solution of cyclopropylamine $(95.2 \mathrm{~g}, 1.67 \mathrm{~mol})$ in 2-propanol ( 240 mL ). After heating at 70 ${ }^{\circ} \mathrm{C}$ for 1.5 h , the solution was stirred at ambient temperature for 15 h and concentrated, and the residue was distilled at 116-119 ${ }^{\circ} \mathrm{C}$ at 1.6 mm to yield $88 \mathrm{~g}(79 \%)$ of $18 \mathrm{a}:{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.45$ $(4 \mathrm{H}, \mathrm{m}), 2.15(1 \mathrm{H}, \mathrm{m}), 2.8(2 \mathrm{H}, \mathrm{m}), 3.6(6 \mathrm{H}, \mathrm{m}, 3$ exch $)$.

A mixture of $18 \mathrm{a}(67 \mathrm{~g}, 0.52 \mathrm{~mol}$ ), benzaldehyde ( $200 \mathrm{~mL}, 1.98$ mol), benzoic acid ( 3 g ), and toluene ( 110 mL ) was heated at reflux for 3 h while collecting the azeotroped $\mathrm{H}_{2} \mathrm{O}$. The solution was then cooled, washed with saturated $\mathrm{NaHCO}_{3}$ and saturated NaCl , dried, and filtered, and the filtrate was concentrated. The excess benzaldehyde was removed under high vacuum at 0.2 mm , and the product was distilled at $130-135^{\circ} \mathrm{C}$ at 0.2 mm to yield 54 g ( $47 \%$ ) of 19a: ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.3(4 \mathrm{H}, \mathrm{m}), 1.95(1 \mathrm{H}, \mathrm{m})$, $2.85(1 \mathrm{H}, \mathrm{s}$, exch $), 3.15(2 \mathrm{H}, \mathrm{m}), 3.7(2 \mathrm{H}, \mathrm{m}), 4.25(1 \mathrm{H}, \mathrm{m}), 5.1$ and $5.15(1 \mathrm{H}, 2 \mathrm{~s}), 7.15(5 \mathrm{H}, \mathrm{br} \mathrm{s})$.

A mixture of $19 \mathrm{a}(6.8 \mathrm{~g}, 0.03 \mathrm{~mol})$ in $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}(12 \mathrm{~mL})$ was cooled at $0-4{ }^{\circ} \mathrm{C}$, and $p$-toluenesulfonyl chloride $(5.9 \mathrm{~g}, 0.03 \mathrm{~mol})$ was added portionwise while keeping the temperature below $25^{\circ} \mathrm{C}$. After 3 h at $25^{\circ} \mathrm{C}$, a cold solution of $\mathrm{K}_{2} \mathrm{CO}_{3}(4.3 \mathrm{~g}, 0.03 \mathrm{~mL})$ in $\mathrm{H}_{2} \mathrm{O}(25 \mathrm{~mL})$ was added, and the mixture was extracted with $\mathrm{CHCl}_{3}$ (3 times). The extracts were washed with $\mathrm{H}_{2} \mathrm{O}$, dried, and filtered, and the filtrate was concentrated first at $20-\mathrm{mm}$ pressure and then at 1 mm while keeping the temperature below $50^{\circ} \mathrm{C}$ to yield $11.3 \mathrm{~g}(97 \%)$ of $11 \mathrm{a}:{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.3(4 \mathrm{H}, \mathrm{m})$, $1.8(1 \mathrm{H}, \mathrm{m}), 2.41(3 \mathrm{H}, \mathrm{s}), 3.1(2 \mathrm{H}, \mathrm{m}), 4.15(3 \mathrm{H}, \mathrm{m}), 5.1(1 \mathrm{H}$, s), $7.45(9 \mathrm{H}, \mathrm{m})$.

To a solution of $2 \mathrm{~b}(7.0 \mathrm{~g}, 0.03 \mathrm{~mol})$ in DMF ( 50 mL ) was added, under $\mathrm{N}_{2}$ at $60^{\circ} \mathrm{C}, \mathrm{NaH}$ ( $50 \%$ oil dispersion, $1.4 \mathrm{~g}, 0.03 \mathrm{~mol}$ ). After 0.5 h , a solution of $11 \mathrm{a}(11.3 \mathrm{~g}, 0.03 \mathrm{~mol})$ in DMF ( 45 mL ) was added, and the mixture was heated at reflux for 16 h . The cooled reaction mixture was then poured into $\mathrm{H}_{2} \mathrm{O}$, and the solution was extracted with $\mathrm{Et}_{2} \mathrm{O}$ (3 times). The combined organic layers were extracted with cold $1 \mathrm{~N} \mathrm{HCl}(3 \times 75 \mathrm{~mL})$, the acid layer was added to NaOAc ( $18.5 \mathrm{~g}, 0.23 \mathrm{~mol}$ ), and the solution was stirred at ambient temperature for 5 h . ${ }^{21}$ The solution was extracted with $\mathrm{Et}_{2} \mathrm{O}$ (2 times), basified with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$, and extracted with $10 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ (3 times). The organic layers were dried and filtered, and the filtrate was concentrated. The residue was chromatographed on silica gel, and the product was eluted with $5 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ saturated with $\mathrm{NH}_{3}$ to yield $0.43 \mathrm{~g}(4 \%)$ of free base. The product was converted to the dihydrochloride salt (12) with $\mathrm{EtOH}-\mathrm{HCl}:{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{Me}_{2} \mathrm{SO}-d_{6}\right) \delta 0.75(4 \mathrm{H}, \mathrm{m}), 2.55$ ( $2 \mathrm{H}, \mathrm{m}$ ), $2.8(1 \mathrm{H}, \mathrm{br} \mathrm{m}), 3.2(2 \mathrm{H}, \mathrm{br} \mathrm{m}), 4.4(4 \mathrm{H}, \mathrm{m}), 7.3(3 \mathrm{H}$, dd), $7.75(1 \mathrm{H}, \mathrm{d}, J=4.5 \mathrm{~Hz}), 8.1(2 \mathrm{H}, \mathrm{s}), 8.5(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz})$, $9.5(2 \mathrm{H}$, br s, exch).

The preparation of (S)-2-phenyl-3-[2-(3,4-dimethoxyphenyl)-ethyl]-5-(hydroxymethyl)oxazolidine $p$-toluenesulfonate (11b) is
(21) Previous attempts to hydrolyze the oxazolidine intermediate were carried out in 1 N HCl , and gross mixtures were obtained. Utilization of dilute acetic acid to effect hydrolysis afforded 12.
presented as an example. Use of cyclopropylamine in place of 2-(3,4-dimethoxyphenyl)ethylamine in this sequence yielded oxazolidine ( $S$ )-11a.
(S)-3-[[2-(3,4-Dimethoxyphenyl)ethyl]amino]-1,2propanediol (18b). To an ice cooled solution of $20(128.7 \mathrm{~g}, 0.49$ mol ) in THF ( 650 mL ) was added portionwise, with stirring, dry $\mathrm{Pb}(\mathrm{OAc})_{4}(220 \mathrm{~g}, 0.5 \mathrm{~mol})$ while maintaining the temperature below $10^{\circ} \mathrm{C}$. The solution was stirred for 30 min at $0-4^{\circ} \mathrm{C}$ and then for 30 min at ambient temperature. The mixture was filtered through Super-Cel, the pad was washed with THF ( 500 mL ), and the cooled yellow solution was treated with 2-(3,4-dimethoxyphenyl)ethylamine ( $331 \mathrm{~g}, 1.8 \mathrm{~mol}$ ). After the addition, the thick suspension was stirred for 1 h at ambient temperature and then cooled to $0-4{ }^{\circ} \mathrm{C}$, and a solution of $\mathrm{NaBH}_{4}(38 \mathrm{~g}, 1 \mathrm{~mol})$ in $4 \%$ $\mathrm{NaOH}(600 \mathrm{~mL})$ was added with vigorous stirring while keeping the temperature below $10^{\circ} \mathrm{C}$. After the additon, the solution was stirred for 0.5 h at $0-4{ }^{\circ} \mathrm{C}$ and then for 1.5 h at ambient temperature, and then the pH was adjusted to 9.4 with solid $\mathrm{NH}_{4} \mathrm{Cl}$. The organic solvents were removed under reduced pressure, and the resulting solution was extracted with $\mathrm{CHCl}_{3}$ ( 3 times). The combined extracts were dried and filtered, and the filtrate was concentrated. The residue was treated with cold $2 \mathrm{NHCl}(1 \mathrm{~L})$ and stirred at ambient temperature. After 18 h , the solution was neutralized with solid $\mathrm{K}_{2} \mathrm{CO}_{3}$ and extracted with EtOAc, and the extract was saturated with NaCl . The aqueous solution was then continuously extracted for 5 days with $\mathrm{CHCl}_{3}$, and the organic layer was concentrated to yield 360 g of a mixture of starting amine and 18 b . The residue was chromatographed on silica gel and eluted first with $5 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ saturated with $\mathrm{NH}_{3}$ to yield 138 g ( $90 \%$ recovery of excess starting amine) and then with $10 \%$ $\mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ saturated with $\mathrm{NH}_{3}$ to give $195 \mathrm{~g}(77 \%)$ of 18 b : trituration with hexane; mp $52-56^{\circ} \mathrm{C}$; $[\alpha]^{25} \mathrm{D}-16.5^{\circ}$ (c 1.946, 1 $\mathrm{N} \mathrm{HCl}) ;{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 2.7(6 \mathrm{H}, \mathrm{m}), 3.0(3 \mathrm{H}, \mathrm{br} \mathrm{s}), 3.6(2$ H , br s), $3.8(7 \mathrm{H}, 2 \mathrm{~s}, \mathrm{~m})$, $6.7(3 \mathrm{H}, \mathrm{br} \mathrm{s})$. Anal. $\left(\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{NO}_{4}\right) \mathrm{C}$, $\mathrm{H}, \mathrm{N}$.
(S )-2-Phenyl-3-[2-(3,4-dimethoxyphenyl)ethyl]-5-(hydroxymethyl)oxazolidine $p$-Toluenesulfonate (11b). A solution of $18 \mathrm{~b}(195 \mathrm{~g}, 0.76 \mathrm{~mol})$, benzoic acid $(3.0 \mathrm{~g})$, benzaldehyde ( 270 mL ), and $\mathrm{C}_{6} \mathrm{H}_{6}(180 \mathrm{~mL})$ was heated at reflux while collecting the azeotroped water. After 2.5 h , the theoretical amount of $\mathrm{H}_{2} \mathrm{O}$ ( 13 mL ) was collected, and the solution was cooled and washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$. The aqueous layer was further extracted with $\mathrm{CHCl}_{3}$, the combined $\mathrm{CHCl}_{3}$ layers were dried and filtered, and the filtrate was concentrated first at $20-\mathrm{mm}$ pressure and then a 1 mm to remove excess benzaldehyde to yield $19 \mathrm{~b}(205 \mathrm{~g}):{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ) $\delta 2.6(6 \mathrm{H}, \mathrm{m}), 3.4(2 \mathrm{H}, \mathrm{m}), 3.75(7 \mathrm{H}, 2 \mathrm{~s}, \mathrm{~m}), 4.3$ $(1 \mathrm{H}, \mathrm{m}), 4.75+4.80(1 \mathrm{H}, 2 \mathrm{~s}), 6.7(3 \mathrm{H}, \mathrm{m}), 7.4(5 \mathrm{H}, \mathrm{br} \mathrm{s})$.
To a solution of $19 b(34.3 \mathrm{~g}, 0.1 \mathrm{~mol})$ in $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}(45 \mathrm{~mL})$ cooled to $0-5{ }^{\circ} \mathrm{C}$ was added portionwise $p$-toluenesulfonyl chloride (19.3, 0.1 mol ) while maintaining the temperature below $30^{\circ} \mathrm{C}$. After 3 h at $0-5^{\circ} \mathrm{C}, \mathrm{CHCl}_{3}$ was added, and the solution was washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$. The aqueous layer was then extracted with $\mathrm{CHCl}_{3}$ ( 2 times), the combined extracts were dried and filtered, and the filtrate was concentrated first at $20-\mathrm{mm}$ pressure and then at 1 mm while keeping the temperature below $50^{\circ} \mathrm{C}$ to yield $49.7 \mathrm{~g}(100 \%)$ of $11 \mathrm{~b}:{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 2.35(3 \mathrm{H}, \mathrm{s})$, $2.55(6 \mathrm{H}, \mathrm{br} \mathrm{s}), 3.75(3 \mathrm{H}, \mathrm{s}), 3.8(3 \mathrm{H}, \mathrm{s}), 4.15(3 \mathrm{H}, \mathrm{m}), 4.7$ and $4.75(1 \mathrm{H}, 2 \mathrm{~s}), 6.65(3 \mathrm{H}, \mathrm{br} \mathrm{s}), 7.5(9 \mathrm{H}, \mathrm{m})$. The compound was used directly in the next step without further purification as described in method $D$.

Method D. The synthesis of $(S)-8$ is presented as an example of the synthetic method. Reaction of 2 a with ( $S$ )-11a yielded (S)-p-[3-(cyclopropylamino)-2-hydroxypropoxy]benzaldehyde (22). Imidazole formation utilizing trifluoromethylglyoxal ${ }^{7}$ with 22 yielded compound $(S)-1 b$ in essentially the same manner.
(S)-2-[p-[3-[[2-(3,4-Dimethoxyphenyl)ethyl]amino]-2hydroxypropoxy]phenyl]imidazole Dihydrochloride (8). To a suspension of $\mathrm{NaH}(60 \%$ oil dispersion, $1.2 \mathrm{~g}, 0.07 \mathrm{~mol}$ ) in DMF $(20 \mathrm{~mL})$ was added at $70^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ a solution of $2 \mathrm{a}(3.7 \mathrm{~g}, 0.03$ mL ) in DMF ( 30 mL ). After the mixture was stirred for 15 min at $70^{\circ} \mathrm{C}$, a solution of $(S)-11 \mathrm{~b}$ in DMF ( 50 mL ) was added dropwise. After the addition, the mixture was heated at $120^{\circ} \mathrm{C}$ for 18 h . The solution was then poured into $\mathrm{H}_{2} \mathrm{O}$ and extracted with EtOAc (3 times). The organic extracts were washed with $\mathrm{H}_{2} \mathrm{O}$ ( 2 times) and saturated NaCl ( 1 time), dried, and filtered, and the filtrate was concentrated. The residue was treated with
$\mathrm{H}_{2} \mathrm{O}(250 \mathrm{~mL})$ and $\mathrm{AcOH}(25 \mathrm{~mL})$ and stirred overnight at room temperature. The solution was extracted with EtOAc (2 times), neutralized with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$, and extracted with $\mathrm{CHCl}_{3}$ ( 4 times). The organic extracts were dried and filtered, and the filtrate was concentrated to yield 8.5 g of $21:{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right)$ $\delta 2.7(6 \mathrm{H}, \mathrm{m}), 3.75(3 \mathrm{H}, \mathrm{s}), 3.85(3 \mathrm{H}, \mathrm{s}), 4.1(3 \mathrm{H}, \mathrm{m}), 6.7(3 \mathrm{H}$, br s), $6.95(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}), 7.75(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz})$.

A mixture of $21(8.5 \mathrm{~g}, 0.024 \mathrm{~mol}), \mathrm{CH}_{3} \mathrm{OH}(50 \mathrm{~mL}), 40 \%$ aqueous glyoxal ( $10 \mathrm{~mL}, 0.07 \mathrm{~mol}$ ), and $28 \%$ concentrated aqueous $\mathrm{NH}_{3}(15 \mathrm{~mL})$ was allowed to stir at ambient temperature. After 18 h , the $\mathrm{CH}_{3} \mathrm{OH}$ was removed under reduced pressure, and $\mathrm{H}_{2} \mathrm{O}$ was added. The resulting aqueous layer was extracted with $\mathrm{CHCl}_{3}$ ( 4 times), the organic layer was dried and filtered, and the filtrate was concentrated. The residue was chromatographed on silica gel, and the product was eluted with $2 \% \mathrm{CH}_{3} \mathrm{OH}-\mathrm{CHCl}_{3}$ saturated with $\mathrm{NH}_{3}$ to yield 3.0 g of free base. The material was converted to the dihydrochloride salt with $\mathrm{HCl}-\mathrm{EtOH}$ to yield $1.3 \mathrm{~g}(11 \%)$ of (S) -8: $[\alpha]^{25}{ }_{\mathrm{D}}-6.94^{\circ}\left(c 0.562, \mathrm{H}_{2} \mathrm{O}\right) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{Me}_{2} \mathrm{SO}-d_{6}\right) \delta 3.2$ $(6 \mathrm{H}, \mathrm{m}), 3.75(3 \mathrm{H}, \mathrm{s}), 3.85(3 \mathrm{H}, \mathrm{s}), 4.2(3 \mathrm{H}, \mathrm{m}), 6.9(3 \mathrm{H}, \mathrm{m})$, $7.25(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}), 7.75(2 \mathrm{H}, \mathrm{s}), 8.35(2 \mathrm{H}, \mathrm{d}, J=9 \mathrm{~Hz}), 9.35$ ( 2 H , br s, exch).

Pharmacology. To determine in vitro $\beta_{1}$-adrenoceptor activity, female Duncan-Hartley guinea pigs ( $200-300 \mathrm{~g}$ body weight) were killed by cervical dislocation. The extirpated hearts were placed in warm Krebs buffer solution, and the left and right intact atria were isolated from the ventricles and major blood vessels. The left atrium was sutured to a glass mounting rod, and the right atrium was attached to the force-displacement transducer. The preparations were set up in water-jacketed, $10-\mathrm{mL}$, isolated tissue baths with a modified Krebs buffer ( $\mathrm{pH} 7.2, \mathrm{mM}$ ): $\mathrm{NaCl}, 106.1$; $\mathrm{KCl}, 4.63 ; \mathrm{CaCl}_{2}, 2.51 ; \mathrm{MgSO}_{4}, 1.2 ; \mathrm{NaH}_{2} \mathrm{PO}_{4}, 0.88 ; \mathrm{NaHCO}_{3}, 11.9$; Dextrose, 5.6 ; and ascorbic acid, 0.051 . The temperature of the baths was maintained at $37^{\circ} \mathrm{C}$, and the buffer was continuously aerated with $95 \% \mathrm{O}_{2}$ and $5 \% \mathrm{CO}_{2}$. The initial tension of 1 g was applied to the atria following their attachment to the force transducer. The tissues were washed at 0 and 15 min . Fifteen minutes after the second wash, isoproterenol was added to the bath. Seven cumulative doses were given at 1 -min intervals in volumes of 0.1 mL each. At the end of the first concentrationresponse, the tissues were washed at 0 and 15 min and allowed to recover for 30 min , at which time the isoproterenol concen-tration-response series was repeated. The atria were again washed, and the antagonist being tested was added to the bath at 0 and 15 min with a wash in between. At the end of 30 min , isoproterenol was added to the bath but at 5 times the original series concentration; i.e., instead of $1 \times 10^{-9} \mathrm{M}$, it was added at $5 \times 10^{-9}$ $M$ in the presence of the antagonist.

For the determination of in vitro $\beta_{2}$-adrenoceptor blockade, female Duncan-Hartley guinea pigs ( $200-400 \mathrm{~g}$ body weight) were also used. They were killed by a blow to the head, and the trachea was excised and placed in a petri dish containing normal saline. The extraneous tissue was trimmed away, and the tracheal tube was cut lengthwise through the cartilage opposite the line of smooth muscle. Segments of trachea were cut approximately 2 to $3-\mathrm{mm}$ wide. One segment from each of the four guinea pigs per assay was used in each tracheal chain. Segments were placed end to end and tied securely taking care not to tie any of the smooth muscle in the knots. One end of the chain was attached to a glass tissue holder and the other end to a force displacement transducer. The tracheal chains were then placed in $10-\mathrm{mL}$, water-jacketed organ baths containing a modified Krebs buffer solution at $37^{\circ} \mathrm{C}$ containing (mM): $\mathrm{NaCl}, 106.1 ; \mathrm{KCl}, 4.63 ; \mathrm{CaCl}_{2}$, $1.89 ; \mathrm{MgSO}_{4}, 1.16 ; \mathrm{NaH}_{2} \mathrm{PO}_{4}, 1.0 ; \mathrm{NaHCO}_{3} 25.0$; dextrose, 11.1; ascorbic acid, 0.051 ; indomethacin, 0.0014 ; and $\mathrm{PGF}_{2 \alpha}, 0.0014$. The baths were constantly aerated with $95 \% \mathrm{O}_{2}$ and $5 \% \mathrm{CO}_{2}$. An initial $2.0-\mathrm{g}$ tension was applied to each of the chains for exactly 5 min , after which the tension was lowered to 1.0 g . The chains were washed several times and allowed to stabilize for 60 min . After the chains had gained a degree of tension over the $60-\mathrm{min}$ period, cumulative concentrations of the agonist (isoproterenol) were added to the baths at $5-\mathrm{min}$ intervals. After the concen-tration-response curve was established, the tracheal chains were washed and then washed again 15 min later and allowed to stabilize for a total time of 30 mins. The concentration-response curve was repeated, the tissues were washed, and the antagonist was added to the bath. The chains were washed after $15-\mathrm{min}$
exposure to the antagonist, which was then readministered to the bath for a total exposure of 30 min . A concentration-response curve was repeated in the presence of the antagonist.

# Optically Active Catecholimidazolines: A Study of Steric Interactions at $\alpha$-Adrenoreceptors 

Duane D. Miller,,$^{*} \dagger$ Akihiko Hamada, ${ }^{\dagger}$ Edward C. Craig, ${ }^{\ddagger}$ Gary G. Christoph, ${ }^{\ddagger}$ Judith C. Gallucci, ${ }^{\ddagger}$ Peter J. Rice, ${ }^{\dagger}$ Jon W. Banning, ${ }^{\dagger}$ and Popat N. Patil ${ }^{\dagger}$<br>Divisions of Medicinal Chemistry and Pharmacology, College of Pharmacy, and Department of Chemistry, The Ohio State University, Columbus, Ohio 43210. Received August 19, 1982

> The optical isomers and deoxy form of $2-(3,4, \alpha-$-trihydroxybenzyl)imidazoline hydrochloride were examined for their $\alpha$-adrenergic activity on rat aorta. The rank order of stimulant activity was deoxy $(2) \simeq(R)-(-)-1>(S)$-( + )- This is in contrast to catecholamines in which the order of activity is $(R)-(-)$-epinephrine $>(S)-(+)$-epinephrine epinine (deoxyepinephrine). The relative order of potency for the isomers of 2 -(3,4, $\alpha$-trihydroxybenzyl)imidazoline is different than that predicted by the Easson-Stedman theory for stereoisomers of catecholamines. Also, substitution of the deoxy compound 2 with substituents, methyl or benzyl, in the 4-position lowers the $\alpha$-adrenergic agonist activity, and differences observed between optical isomers were small.

Imidazolines are an important class of drugs that interact with $\alpha$-adrenergic receptors. ${ }^{1-10}$ In contrast to phenethanolamines, few studies have appeared in which the actions of optically active imidazolines have been examined for their pharmacological activity. ${ }^{6,11-13}$

The Easson-Stedman theory has provided an important means of explaining the steric structure-activity relationships for the interaction of asymmetric phenethanolamines with the adrenoreceptors. ${ }^{1}$ However, no studies have been carried out with optically active imidazolines to test the validity of the Easson-Stedman theory. In the present study, we have prepared the optical isomers of 2-(3,4, $\alpha$-trihydroxybenzyl)imidazoline hydrochloride [ $3,4, \alpha$-trihydroxytolazoline (1)], and its deoxy form, 2 -(3,4-dihydroxybenzyl)imidazoline hydrochloride [3,4-dihydroxytolazoline (2)], in order to investigate their $\alpha$-adrenergic activity with regard to the Easson-Stedman theory.

Earlier findings indicated that the addition of substituents to the $\alpha$-adrenergic agonist, naphazoline, converted it to an antagonist. ${ }^{6,14}$ Subsequently, we were interested in observing the effect of similar substituents on the catecholimidazoline, 3,4-dihydroxytolazoline hydrochloride (2). We prepared compounds 3, 4, 6, and 7, which provided an opportunity to examine the effects of 4 -substituted catecholimidazolines on $\alpha$-adrenoreceptors. Since only limited studies have been carried out with optically active imidazolines, ${ }^{6,11,12,14}$ it was thought studies of such an im-
