#### Abstract

1H,3H-Pyrido[2,1-f]purine-2,4-diones, which can be described as fused xanthine structures, have been synthesized by a novel synthetic procedure, and their affinities for the human adenosine $A_{1}, A_{2 A}$, and $A_{3}$ receptors have been evaluated in radioligand binding studies. The synthetic procedure employed was developed in our laboratory and involved a two-step onepot reaction that consists of the treatment of 6-aminouracil derivatives with N-bromosuccinimide to generate a 5,5-dibromo-6-imino intermediate that reacts "in situ" with pyridine, 4-methoxypyridine, 4-tert-butylpyridine, or 4-phenylpyridine to afford the corresponding $1 \mathrm{H}, 3 \mathrm{H}$-pyrido-[2,1-f]purine-2,4-diones (2-5). Functionalization at the $\mathrm{N}^{3}$ position in compounds $\mathbf{2 - 5}$ was performed by reaction with DBU and different alkyl, alkenyl, alkynyl, or benzyl halides. Binding studies at human adenosine $A_{1}, A_{2 A}$, and $A_{3}$ receptors revealed significant antagonist effects in the low nanomolar range, in particular against the $A_{3}$ receptor. Thus, the 1-benzyl-3-propyl-1H,3H-pyrido[2,1-f]purine-2,4-dione derivative 6, which can be considered a lead compound in this series, exhibited a $K_{i}$ value of $4.0 \pm 0.3 \mathrm{nM}$ against the $\mathrm{hA}_{3}$ receptor. Because xanthine derivatives have traditionally been considered poor $A_{3}$ antagonists, the described pyrido[2,1-f]purine-2,4-dione derivatives represent a new family of adenosine receptor antagonists which deserves further exploration.

## Introduction

Adenosine exerts physiological effects by the activation of specific cell membrane-bound receptors. To date, four different adenosine receptor subtypes have been identified, named $A_{1}, A_{2 A}, A_{2 B}$, and $A_{3}$. While activation of $A_{1}$ and $A_{3}$ receptor subtypes leads to inhibition of the enzyme adenylate cyclase, $A_{2 A}$ and $A_{2 B}$ subtypes stimulate cAMP production through this enzyme. ${ }^{1,2}$

The xanthine core structure has served as the basis for numerous selective antagonists for adenosine $A_{1}$, $A_{2 A}$, and $A_{2 B}$ receptors, while at the level of $A_{3}$ receptors, xanthines are much less potent. Therefore, the search for $\mathrm{A}_{3}$ receptor antagonists has relied on library screening, and this explains the structural diversity among $\mathrm{A}_{3}$ receptor antagonists which include triazol onaphthopyridines, ${ }^{3}$ thiazolopyrimidines, ${ }^{3}$ pyridines and 1,4dihydropyridines, ${ }^{4-8}$ triazoloquinazolines, ${ }^{9,10}$ flavonoids, ${ }^{11}$ triazol opyrimidines, ${ }^{12,13}$ isoquinolines, ${ }^{14-16}$ and thiazoles and thiadiazoles. ${ }^{17}$

We have recently reported a new and simple synthesis of pyrido[2,1-f]purine-2,4-dione derivatives, ${ }^{18}$ the general formula of which is represented in Chart 1. Such structures can also be described as fused xanthine derivatives, and therefore, we were interested in evaluating these compounds with the adenosine receptors.

[^0]Chart 1. General Formula and Numbering of 1H,3H-Pyrido[2,1-f]purine-2,4-diones

In this study, we describe the synthesis of an extended series of such pyridopurinedione derivatives and their affinities for the human adenosine $A_{1}, A_{2 A}$, and $A_{3}$ receptors, as evaluated in radioligand binding studies. We learned that most compounds show moderate antagonist effects at the level of $A_{1}$ receptors, low or negligible activity at the level of $A_{2 A}$ receptors, and substantial affinity at the $\mathrm{A}_{3}$ adenosine receptor.

## Results and Discussion

Chemistry. In the course of our research program on the synthesis of 6 -aminouracil derivatives, ${ }^{19,20}$ we recently reported that treatment of 6-amino-1-benzyluracil with excess N-bromosuccinimide (NBS) in pyridine afforded, besides the expected 6-amino-5-bromo derivative, a second strong UV absorbing product that was identified as 1-benzyl-1H,3H-pyrido[2,1-f]purine-2,4dione. ${ }^{18} \mathrm{~A}$ careful examination of the reaction conditions led us to propose that the reaction pathway involves a 5,5-dibromination of the 6-aminouracil derivative that further reacts with the pyridine present in the reaction

Scheme 1. Synthesis of 3-Substituted 1-Benzyl-1H,3H-pyrido[2,1-f]purine-2,4-dione Derivatives

medium to generate the tricyclic structure. This represents a novel synthetic pathway for obtaining such 1H,3H-pyrido[2,1-f]purine-2,4-dione skeletons. Previous records on such structures are scarce and involve a twostep synthesis by reaction of 6-chloro-1,3-dial kyluracils with 2-ami nopyridines in the presence of NaH , followed by heating with thionyl chloride. ${ }^{21,23}$ Our optimized synthetic procedure for obtaining these $1 \mathrm{H}, 3 \mathrm{H}$-pyrido-[2,1-f]purine-2,4-diones is a two-step one-pot reaction that consists of treatment of the 6-aminouracil derivative with 2.5 equiv of NBS in acetonitrile to generate the intermediate 5,5-di bromo-6-imino derivative which is not isolated but reacted "in situ" with different pyridines to afford the target compounds. ${ }^{18}$ Therefore, according to this approach, treatment of 6-amino-1benzyluracil (1) ${ }^{23}$ (Scheme 1) with 2.5 equiv of NBS in acetonitrile at $80^{\circ} \mathrm{C}$ followed by the addition of pyridine, 4-methoxypyridine, 4-tert-butylpyridine, or 4-phenylpyridine afforded the corresponding 1-benzyl-1H,3H-py-rido[2,1-f]purine-2,4-diones (2-5) in 60, 74, 58, and 59\% yields, respectively. In all cases, a variable amount (15$25 \%$ ) of 6-amino-1-benzyl-5-bromouracil ${ }^{18,23}$ was also obtained. The structures of $2-5$ were unequivocally determined by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR, HMQC, and HMBC experiments, and elemental composition was established by mass spectrometry and combustion analysis.

Attempts to alkylate the $\mathrm{N}^{3}$ position of $\mathbf{2}$ by reaction with $\mathrm{K}_{2} \mathrm{CO}_{3}$ and propyl iodide were unsuccessful. However, reacting 2 with DBU and propyl iodide in dry $\mathrm{CH}_{3}-$ CN at room temperature afforded the 3-propyl derivative 6 in 65\% yield (Scheme 1). Under similar reaction conditions, derivatives 3, 4, and 5 were transformed into their corresponding 3-propyl analogues 7, 8, and 9, in 82,75 , and $93 \%$ yields, respectively. The smoothness of these reaction conditions allowed the introduction of different alkyl, alkenyl, al kynyl, or benzyl substituents at position 3 of the core structure 2; their chemical structures (10-20) are represented in Scheme 1. In general, the yields obtained were from good to excellent, and the only other product detected on TLC was unreacted starting material. It should also be mentioned

Scheme 2. Synthesis of
1-M ethyl-3-propyl-1H,3H-pyrido[2,1-f]purine-2,4-dione (23)

a) and b): same conditions as described in Scheme 1
that, based on spectroscopic data, alkylation occurs exclusively at the $\mathrm{N}^{3}$ position.
To explore the importance of the substituent at position 1 while keeping a propyl at position 3 (see the Binding Studies and Structure-Affinity Relationships), two synthetic approaches were followed. The first approach involved a reaction of the corresponding $\mathrm{N}^{1-}$ substituted 6-aminouracil derivative with NBS followed by treatment with pyridine, as exemplified for the 6-amino-1-methyluracil ${ }^{24}$ (21) in Scheme 2. This procedure afforded the 1-methyl-1H,3H-pyrido[2,1-f]purine-2,4-dione (22) which was not easy to isolate and, therefore, was further alkylated at position 3 by a reaction with propyl iodide. In this way, 1-methyl-3-propyl-1H ,3H-pyrido[2,1-f]purine-2,4-dione (23) was prepared. The second approach (Scheme 3) involved debenzylation of the lead compound 6 to afford the NH free compound $\mathbf{2 4}$ which could be further modified at position 1. Debenzylation was performed by treatment of 6 with $\mathrm{AICl}_{3}$ in dry toluene, ${ }^{25}$ affording 24 in $80 \%$ yield. Then, a reaction of 24 with 4-methoxybenzyl bromide or 3-methylbenzyl bromide in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ yielded the $\mathrm{N}^{1}$-substituted benzyl derivatives $\mathbf{2 5}$ and 26 in 89 and $83 \%$ yields, respectively.

Binding Studies and Structure-Affinity Relationships. All synthesized compounds were tested in radioligand binding assays to determine their affinities for the adenosine $A_{1}, A_{2 A}$, and $A_{3}$ receptors. The affinities at human adenosine $A_{1}$ receptors were determined

[^1]on membranes of CHO cells stably expressing this receptor, using [ $\left.{ }^{3} \mathrm{H}\right]$ DPCPX as the radioligand. Affinities at human adenosine $\mathrm{A}_{2 \mathrm{~A}}$ receptors were measured in a similar preparation with [ $\left.{ }^{3} \mathrm{H}\right] Z \mathrm{Z} 241385$ as the radioligand. The affinity at adenosine $\mathrm{A}_{3}$ receptors was determined on membranes from HEK 293 cells stably expressing the human $A_{3}$ receptor, using [ ${ }^{125}$ ] ]AB-MECA as the radioligand. The results are shown in Tables 1 and 2.

The initially synthesized fused xanthine structures (2-5) exhibited significant affinity at the human adenosine $A_{3}$ receptor in the low micromolar range (0.2$0.6 \mu \mathrm{M})$, while they exhibited negligible affinity at adenosine $A_{1}$ and $A_{2 A}$ receptors ( $<50 \%$ ligand displacement at $10 \mu \mathrm{M}$, Table 1). These data were crucial in our research because, traditionally, xanthine derivatives have been considered good leads for $A_{1}$ and $A_{2 A}$ antagonists, but their affinity for the $\mathrm{A}_{3}$ receptor was al ways weaker. ${ }^{26}$ To the best of our knowl edge, compounds 2-5 represent the first example of xanthine derivatives that show selectivity for the $A_{3}$ receptor. These findings urged us to explore this new family of compounds as adenosine antagonists by introducing modifications at positions 1, 3, and 8 of the core structure of $1 \mathrm{H}, 3 \mathrm{H}-$ pyrido[2,1-f]purine-2,4-dione.

Introduction of a propyl moiety at position $\mathrm{N}^{3}$ in compounds 2-5 (Table 1) led to a marked increase in affinity for all three adenosine receptors, in particular
for the $A_{3}$ receptor. Thus, the $N^{3}$-propyl derivative 6 exhibited almost an 100-fold increased affinity at the human adenosine $A_{3}$ receptor compared to the unsubstituted compound $\mathbf{2}$, with a $K_{i}$ value of $4.0 \pm 0.3 \mathrm{nM}$. Compound 6 also exhibited significant affinity for the $A_{1}$ and $A_{2 A}$ receptors, but the selectivity for the $A_{3}$ receptor was clear (ratio of $\mathrm{hA}_{1}: \mathrm{hA}_{3}$ around 13 and ratio of $\mathrm{hA}_{2 \mathrm{~A}}:$ hA $_{3}$ close to 30). Also, a marked increase in the $A_{3}$ affinity was observed for compounds 7 and 9 when compared to their parent compounds $\mathbf{3}$ and $\mathbf{5}$, respectively. Compound 9 may also be the most selective in the series, displaying at least 300-fold selectivity versus human $A_{1}$ and $A_{2 A}$ receptors. Only the bulky tert-butyl derivative 8 was considerably less active against the three receptor subtypes. It was concluded that the introduction of a propyl moiety at the $\mathrm{N}^{3}$ position increases the affinity for all three receptors while retaining the selectivity for the human $A_{3}$ receptors. Therefore, these pyrido[2,1-f]purine-2,4-dione derivatives can be considered as a new family of potent antagonists for the human $A_{3}$ receptor.

Because the introduction of a propyl moiety at position $\mathrm{N}^{3}$ of the core structure $\mathbf{2}$ had such an impact on the affinity for the adenosine receptors, the influence of different alkyl, alkenyl, alkynyl, and benzyl substituents at position 3 of compound $\mathbf{2}$ was explored (Table 1). Among the alkyl substituents, the ethyl derivative 10 was almost 1 order of magnitude less potent on all three receptors than the propyl analogue 6, while the methylcyclopropyl and isobutyl derivatives (compounds 11 and 12, respectively) were as potent as 6 on the human $A_{3}$ receptors, with $K_{i}$ values in the low nanomolar range and only differing in the degree of selectivity versus the other receptor subtypes. Only the more bulky methylcyclohexyl derivative 13 was considerably less potent ( 30 -fold) at the $\mathrm{A}_{3}$ receptor than the propyl derivative 6 . The rigidity of the chain at position $N^{3}$ was investigated by introducing unsaturated chains, such as allyl (14) or propargyl (15). These results indicate that such conformational restriction did not markedly affect affinity or selectivity in all three receptor subtypes. However, functionalization of the alkyl or alkenyl chain, as exemplified by the methyl ester 16 or the amine 18, has a detrimental effect on all three adenosine receptors. Finally, introduction of a benzyl (19) or 4-methoxybenzyl (20) substituent at position 3 of the core structure 2 abolishes the affinity for the $A_{1}$ and $A_{2 A}$ receptors, while the affinity for $A_{3}$ receptors is reduced 20- and 50-fold, respectively, when compared to the affinity of propyl derivative 6. These data indicate that steric demands at this position are more stringent at the level of $A_{1}$ and $A_{2 A}$ than at the $A_{3}$ receptor.

In a final series of modifications, the propyl substituent was kept at position $\mathrm{N}^{3}$ of the pyrido[2,1-f]purine-2,4-dione structure while modifications were incorporated at $\mathrm{N}^{1}$ (Table 2). A dramatic reduction of affinity and selectivity was observed by the replacement of the benzyl substituent in 6 by a methyl moiety, as shown for compound 23. This $\mathrm{N}^{1}$-methyl derivative had affinity for the $A_{1}$ and $A_{3}$ receptors in only the micromolar range, being 1000-fold less active than the benzyl derivative 6. Next, substitutions were performed on the benzyl moiety at position $\mathrm{N}^{1}$. Thus, the 4-methoxybenzyl derivative (25) almost kept the affinity of the benzyl
derivative 6 for $A_{1}$ and $A_{3}$ receptors but lost its affinity for theh $A_{2 A}$ receptor, so selectivity was increased. M ore pronouncedly, the 3-methylbenzyl derivative (26) did not show significant affinity for the $A_{1}$ and $A_{2}$ receptors at $10 \mu \mathrm{M}$, while affinity for the $\mathrm{A}_{3}$ receptor was reduced 15 -fold when compared to that of the benzyl derivative 6. Therefore, these data point to the importance of the benzyl substituent at position $\mathrm{N}^{1}$ with regard to selectivity versus the different receptor subtypes among this new family of adenosine receptor antagonists.

## Conclusions

1H,3H-Pyrido[2,1-f]purine-2,4-diones, a novel class of fused xanthine structures, represent a new family of potent $A_{3}$ receptor antagonists with affinities in the low nanomolar range. These compounds were prepared by a new synthetic procedure in a two-step one-pot reaction which consists of treatment of 6-aminouracil derivatives with NBS to generate a 5,5-dibromo-6-imino intermediate that reacts in situ with different pyridines to afford the $1 \mathrm{H}, 3 \mathrm{H}$-pyrido[2,1-f]purine-2,4-diones. Functionalization at the $\mathrm{N}^{3}$ position was performed smoothly, allowing for the introduction of different alkyl, alkenyl, alkynyl, or benzyl substituents. Structure-affinity reIationships at the three adenosine receptors $\left(A_{1}, A_{2 A}\right.$, and $A_{3}$ ) established the basic requirements in this family of compounds for affinity versus the different adenosine receptors. Their potency, in particular against the $\mathrm{A}_{3}$ receptor and exemplified by 1-benzyl-3-propyl1H ,3H-pyrido[2,1-f]purine-2,4-dione derivative 6 with a $K_{i}$ value of $4.0 \pm 0.3 \mathrm{nM}$, supports their potential value as a new family of adenosine receptor antagonists which deserves further exploration.

## Experimental Section

Chemical Procedures. Melting points were obtained on a Reichert-J ung Kofler apparatus and are uncorrected. Microanalyses were obtained with a Heraeus CHN-O-RAPID instrument. Electrospray mass spectra were measured on a quadrupole mass spectrometer equipped with an electrospray source (Hewlett-Packard, LC-MS HP 1100). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Gemini spectrometer operating at $200\left({ }^{1} \mathrm{H}\right)$ and $50 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, respectively, a Varian INNOVA 300 spectrometer operating at $299\left({ }^{1} \mathrm{H}\right)$ and 75 MHz $\left({ }^{13} \mathrm{C}\right)$, respectively, and a Varian INNOVA 400 spectrometer operating at $399\left({ }^{1} \mathrm{H}\right)$ and $99 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, respectively. Monodimensional ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ spectra were obtained using standard conditions. Two-dimensional inverse proton-detected heteronuclear one-bond shift correlation spectra were obtained using the Pulsed Field Gradient HSQC pulse sequence. Data were col lected in a $2048 \times 512$ matrix with a spectral width of 3460 Hz in the proton domain and a $2048 \times 1024$ matrix with a spectral width of 22500 Hz in the carbon domain. The experiment was optimized for a one-bond heteronuclear coupling constant of 150 Hz . Two-dimensional inverse protondetected heteronuclear long-range shift correlation spectra were obtained using the Pulsed Field Gradient HMBC pulse sequence. The HMBC experiment was carried out in the same conditions as the HSQC experiment and optimized for longrange coupling constants of 7 Hz .

Analytical TLC was performed on silica gel $60 \mathrm{~F}_{254}$ (Merck) precoated plates ( 0.2 mm ). Spots were detected under UV light ( 254 nm ) and/or by charring with phosphomolybdic acid and/ or ninhydrin. Separations on silica gel were performed by preparative centrifugal circular thin-layer chromatography (CCTLC) on a Chromatotron instrument (Kiesegel $60 \mathrm{PF}_{254}$ gipshaltig, Merck), with a layer thickness of 1 or 2 mm and a flow rate of 4 or $8 \mathrm{~mL} / \mathrm{min}$, respectively. Flash column
chromatography was performed with silica gel 60 (230-400 mesh, Merck).

All experiments involving water-sensitive compounds were conducted under scrupulously dry conditions. Acetonitrile and toluene were dried by refluxing over calcium hydride. Anhydrous $\mathrm{N}, \mathrm{N}^{\prime}$-dimethylformamide was purchased from Aldrich.

General Procedure for the Synthesis of 1-Benzyl-1H,3H-pyrido[2,1-f]purine-2,4-diones. N -Bromosuccinimide (NBS) ( $445 \mathrm{mg}, 2.5 \mathrm{mmol}$ ) was added into a suspension of 6-amino-1-benzyluracil (1) ( $217 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{3} \mathrm{CN}$ $(8 \mathrm{~mL})$, and the mixture was heated at $80^{\circ} \mathrm{C}$ for 1 h . After the mixture was cooled to room temperature, the corresponding pyridine ( $5-10 \mathrm{mmol}$ ) was added, and the resulting mixture was heated at $80^{\circ} \mathrm{C}$ for 6 h . The resulting precipitate, which contains the target compound, was collected by filtration and washed with ethyl ether. Evaporation of the filtrate, washing of the solid obtained with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 5 \mathrm{~mL})$, and purification of this solid by CCTLC on the Chromatotron instrument ( $\mathrm{CH}_{2}{ }^{-}$ $\mathrm{Cl}_{2} / \mathrm{MeOH}$ mixtures) afforded a second portion of the target compound followed by varying amounts ( $15-25 \%$ ) of 6-amino-1-benzyl-5-bromouracil.

General Procedure for the Preparation of $\mathbf{N}^{\mathbf{3}}$-Substituted 1-Benzyl-1H,3H-pyrido[2,1-f]purine-2,4-diones. A solution of the corresponding pyridopurinedione (2-5) (0.30 mmol ) in dry $\mathrm{CH}_{3} \mathrm{CN}(3 \mathrm{~mL})$ was reacted with DBU $(0.05 \mathrm{~mL}$, 0.33 mmol ) and the corresponding al kyl, alkenyl, al kynyl, or benzyl halide ( 0.45 mmol ) at room temperature or at $80^{\circ} \mathrm{C}$. After $4-6 \mathrm{~h}$, volatiles were removed. The residue was taken up in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ and washed with $1 \mathrm{~N} \mathrm{HCl}(20 \mathrm{~mL})$, water $(20 \mathrm{~mL})$, and brine ( 20 mL ). The organic phase was dried on anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and evaporated. The residue was purified by CCTLC on the Chromatotron instrument (2:1 ratio of hexane/EtOAc) except where specified.

1-Benzyl-3-propyl-1H,3H-pyrido[2,1-f]purine-2,4-dione (6). Compound $\mathbf{6}$ was obtained by the reaction of $\mathbf{2}$ with propyl iodide. Yield: $65 \% . \mathrm{Mp}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}\right): 163-165{ }^{\circ} \mathrm{C}$.

3-Propyl-1H ,3H-pyrido[2,1-f]purine-2,4-dione (24). To a stirred solution of $\mathbf{6}(156 \mathrm{mg}, 0.47 \mathrm{mmol})$ in toluene ( 5 mL , freshly distilled) under an argon atmosphere was added dry $\mathrm{AlCl}_{3}(311 \mathrm{mg}, 2.34 \mathrm{mmol})$, and the mixture was heated at 60 ${ }^{\circ} \mathrm{C}$ for 1 h . After the mixture was cooled to room temperature, iced water ( 10 mL ) and EtOAc ( 20 mL ) were added, and stirring was continued for 30 min . The aqueous phase was further extracted with EtOAc $(3 \times 20 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and evaporated. The residue was purified by flash column chromatography ( $40: 1$ ratio of $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ ) to yield 91 mg (80\%) of 24. Mp $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}\right): 274-276{ }^{\circ} \mathrm{C}$. MS (ES, positive mode): $\mathrm{m} / \mathrm{z}$ $\left.245\left[(\mathrm{M}+1)^{+}\right], 267[\mathrm{M}+\mathrm{Na})^{+}\right] .{ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}\right) \delta: 0.87$ ( t , J $=7.5 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), $1.59\left(\mathrm{~m}, \mathrm{~J}=7.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $3.83(\mathrm{t}, \mathrm{J}=6.1 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{NCH} 2), 7.22(\mathrm{t}, \mathrm{J}=6.8 \mathrm{~Hz}, \mathrm{H}-7), 7.61-$ 7.70 (m, 2H, H-8, H-9), 8.95 (d, J = $6.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-6$ ), 12.13 (br s, 1H, NH). ${ }^{13} \mathrm{C}$ NMR (DMSO-d ${ }_{6}$ ) $\delta: 11.21\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 20.92$ $\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 41.11\left(\mathrm{NCH}_{2}\right), 100.91(\mathrm{C}-4 a), 114.21(\mathrm{C}-7), 115.91$ (C-9), 127.00 (C-6), 130.39 (C-8), 147.35 (C-9a), 149.78, 151.13 (C-10a, C-2), 154.99 (C-4). Anal. ( $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{~N}_{4} \mathrm{O}_{2}$ ) C, H, N.

1-(4-Methoxybenzyl)-3-propyl-1H,3H-pyrido[2,1-f]pu-rine-2,4-dione (25). To a stirred solution of 24 ( $66 \mathrm{mg}, 0.27$ $\mathrm{mmol})$ in anhydrous DMF ( 4.2 mL ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(56 \mathrm{mg}$, 0.40 mmol ), and the mixture was stirred at room temperature for 1 h . Then, 4-methoxybenzyl chloride ( $42 \mu \mathrm{l}, 0.31 \mathrm{mmol}$ ) was added, and the reaction mixture was heated at $40^{\circ} \mathrm{C}$ for 3 h . After the mixture had cooled to room temperature, volatiles were removed, and the residue was taken up in EtOAc (50 mL ) and washed with a saturated $\mathrm{NaHCO}_{3}$ sol ution ( 20 mL ). The organic phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and evaporated. The residue was purified by CCTLC on the Chromatotron instrument using hexane/EtOAc (2:1) as eluent to yield $88 \mathrm{mg}(89 \%)$ of $\mathbf{2 5 .} \mathrm{Mp}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}\right): 165-167^{\circ} \mathrm{C} . \mathrm{MS}(\mathrm{ES}$, positive mode): $\mathrm{m} / \mathrm{z} 365\left[(\mathrm{M}+1)^{+}\right], 387\left[(\mathrm{M}+\mathrm{Na})^{+}\right]$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 0.97\left(\mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.70(\mathrm{~m}, \mathrm{~J}=7.6 \mathrm{~Hz}$, $\left.2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.76\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 4.02(\mathrm{t}, \mathrm{J}=7.6 \mathrm{~Hz}, 2 \mathrm{H}$, $\left.\mathrm{NCH}_{2}\right), 5.32\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}\right), 6.84(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ph}), 7.08$ $(\mathrm{m}, \mathrm{J}=6.7,1.2 \mathrm{~Hz}, \mathrm{H}-7), 7.54-7.57(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ph}, \mathrm{H}-8), 7.69$ $(\mathrm{m}, \mathrm{J}=8.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-9), 9.05(\mathrm{~m}, \mathrm{~J}=6.6,1.2 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{H}-6) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 11.32\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 21.37\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$, $42.78\left(\mathrm{NCH}_{2}\right), 46.14\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 55.18\left(\mathrm{OCH}_{3}\right), 113.82(\mathrm{C}-7)$, 116.38 (C-9), 127.48 (C-6), 113.78, 128.63, 130.37 (Ph), 129.80 (C-8), 147.61 (C-9a), 150.65, 151.36 (C-10a, C-2), 155.00 (C4). Radioligand Binding Studies. Radioligand binding studies were performed on stably transfected cell lines expressing
human adenosine receptors. CHO cells expressing the human adenosine $\mathrm{A}_{1}$ receptor were obtained from Dr . A. TownsendNicholson. These cells were cultured at $37{ }^{\circ} \mathrm{C}$ in a $5 \% \mathrm{CO}_{2}$ atmosphere in a 1:1 mixture of DMEM/F 12, 2 mM Glutamax (a stable anal ogue of glutamine), $10 \%$ newborn calf serum with $50 \mathrm{IU} / \mathrm{mL}$ penicillin, and $50 \mathrm{mg} / \mathrm{mL}$ streptomycin. Dr. S. Rees kindly provided CHO cells expressing the human $\mathrm{A}_{2 \mathrm{~A}}$ receptor. These cells were cultured at $37{ }^{\circ} \mathrm{C}$ in a $5 \% \mathrm{CO}_{2}$ atmosphere in a $1: 1$ mixture of DMEM/F12, 2 mM Glutamax, $10 \%$ newborn calf serum, $1 \mathrm{mg} / \mathrm{mL}$ G418 with $50 \mathrm{IU} / \mathrm{mL}$ penicillin, and 50 $\mathrm{mg} / \mathrm{mL}$ streptomycin. HEK 293 cells expressing human adenosine $\mathrm{A}_{3}$ receptors were from Dr. K.-N. Klotz. These cells were cultured at $37^{\circ} \mathrm{C}$ in a $7 \% \mathrm{CO}_{2}$ atmosphere in a mixture of DMEM, 2 mM Glutamax, $10 \%$ newborn calf serum, $0.5 \mathrm{mg} /$ mL G418 with $50 \mathrm{IU} / \mathrm{mL}$ penicillin, and $50 \mathrm{mg} / \mathrm{mL}$ streptomycin. Confluent cells expressing the human $A_{1}$ or $A_{2 A}$ receptor or semiconfluent cells expressing the human $A_{3}$ adenosine receptor were trypsinized and centrifuged for 10 min at 1000 rpm . The cell pellets were resuspended in 50 mM Tris/HCl ( pH 7.4 ) at room temperature and homogenized on ice for 5 s at position 8 with an $Y$ stral homogenizer. The homogenate was centrifuged for 45 min at 12700 rpm in an SW-30 rotor at 4 ${ }^{\circ} \mathrm{C}$. The resulting pellet was resuspended in 50 mM Tris $/ \mathrm{HCl}$ ( pH 7.4) at room temperature. Adenosine deaminase, 2 IU/ mL , was added, and aliquots were stored at $-80^{\circ} \mathrm{C}$.

Stock solutions of ligands were made in DMSO. The final concentration of DMSO in the assay did not exceed $1 \%$.
[ $\left.{ }^{3} \mathrm{H}\right]$ DPCPX and [ ${ }^{1251}$ ]AB-MECA were obtained from Amersham, and $\left[{ }^{3} \mathrm{H}\right] Z M 241385$ was obtained from Tocris Cookson, Ltd. (Northpoint, U.K.).

Adenosine $\mathbf{A}_{\mathbf{1}}$ Receptor. Membranes containing 40 mg of protein were incubated in a total volume of 400 mL of 50 mM Tris $/ \mathrm{HCl}(\mathrm{pH} 7.4)$ and [ $\left.{ }^{3} \mathrm{H}\right] \mathrm{DPCPX}$ (final concentration, 1.6 nM ) for 1 h at $25^{\circ} \mathrm{C}$ in a shaking water bath. Nonspecific binding was determined in the presence of $10 \mu \mathrm{M} \mathrm{CPA}$. The incubation was terminated by filtration over Whatman GF/B filters under reduced pressure with a Brandell harvester. Filters were washed three times with ice cold buffer and placed in scintilIation vials. Emulsifier Safe ( 3.5 mL ) was added, and after 2 h , radioactivity was counted in an LKB rack $\beta$ scintillation counter.

Adenosine $A_{2 A}$ Receptor. Membranes containing 40 mg of protein were incubated in a total volume of 400 mL of 50 mM Tris/ $\mathrm{HCl}(\mathrm{pH} 7.4)$ and $\left[{ }^{3} \mathrm{H}\right] Z M 241385$ (final concentration, 2.0 nM ) for 2 h at $25^{\circ} \mathrm{C}$ in a shaking water bath. Nonspecific binding was determined in the presence of $100 \mu \mathrm{M}$ CPA. The incubation was terminated by filtration over Whatman GF/B filters under reduced pressure with a Brandell harvester. Filters were washed four times with ice cold buffer and placed in scintillation vials. Emulsifier Safe ( 3.5 mL ) was added, and after 2 h , radioactivity was counted in an LKB rack $\beta$ scintillation counter.

Adenosine $A_{3}$ Receptor. Membranes containing $20-40 \mathrm{mg}$ of protein were incubated in a total volume of 100 mL of 50 mM Tris/ $\mathrm{HCl}, 10 \mathrm{mM} \mathrm{MgCl} 2,1 \mathrm{mM}$ EDTA, $0.01 \%$ CHAPS ( pH 7.4), and [ ${ }^{125}$ ] ]AB-MECA (final concentration, 0.10 nM ) for 1 h at $37^{\circ} \mathrm{C}$ in a shaking water bath. Nonspecific binding was determined in the presence of $100 \mu \mathrm{M}$ R-PIA. The incubation was terminated by filtration over Whatman GF/B filters under reduced pressure with a Brandell harvester. Filters were washed three times with ice cold buffer and placed in vials. Radioactivity was counted by a $\gamma$ counter.

Acknowledgment. Financial support from the Spanish CICYT (SAF 2000-0153-C02-01) is gratefully acknowledged.
