#### Abstract

Efforts to identify a suitable follow-on compound to razaxaban (compound 4) focused on modification of the carboxamido linker to eliminate potential in vivo hydrolysis to a primary aniline. Cyclization of the carboxamido linker to the novel bicyclic tetrahydropyrazolopyridinone scaffold retained the potent fXa binding activity. Exceptional potency of the series prompted an investigation of the neutral $\mathrm{P}_{1}$ moieties that resulted in the identification of the $p$-methoxyphenyl $\mathrm{P}_{1}$, which retained factor Xa binding affinity and good oral bioavailability. Further optimization of the C-3 pyrazole position and replacement of the terminal $\mathrm{P}_{4}$ ring with a neutral heterocycle culminated in the discovery of 1-(4-methoxyphenyl)-7-oxo-6-(4-(2-oxopiperidin1 -yl)phenyl)-4,5,6,7-tetrahydro-1 H -pyrazolo[3,4-c]pyridine-3-carboxamide (apixaban, compound 40). Compound 40 exhibits a high degree of fXa potency, selectivity, and efficacy and has an improved pharmacokinetic profile relative to 4 .

## Introduction

Thrombotic diseases remain the leading cause of death in developed countries despite the availability of anticoagulants such as warfarin, ${ }^{\text {la-c }}$ heparin and low molecular weight heparins, ${ }^{2,3}$ and antiplatelet agents such as aspirin and clopidogrel. The oral anticoagulant warfarin inhibits the post-translational maturation of coagulation factors VII, IX, and X and prothrombin and has proven effective in both venous and arterial thrombosis. However, warfarin's usage is limited because of its narrow therapeutic index, slow onset of therapeutic effect, numerous dietary and drug interactions, and a need for monitoring and dose adjustment. ${ }^{4 \mathrm{a}, \mathrm{b}}$ This not withstanding, warfarin remains the standard orally administered anticoagulant available in the United States. Patients on warfarin therapy require regular monitoring in part because of its narrow therapeutic index and interactions with food and other drugs. Injectable agents that are also widely used include low molecular weight heparins and the synthetic pentasaccharide fondaparinux. ${ }^{5}$ Thus, discovering and developing safe and efficacious oral anticoagulants for the prevention and treatment of a wider range of thrombotic diseases has become increasingly important.

A key strategy for the discovery and development of new anticoagulants has been the targeting of specific enzymes within the blood coagulation cascade. One approach is to inhibit thrombin generation by targeting the inhibition of coagulation factor Xa ( fXa ). ${ }^{5,6 \mathrm{a}-\mathrm{h}}$ Factor Xa, a trypsin-like serine protease, is crucial to the conversion of prothrombin to thrombin, the final enzyme in the coagulation cascade that is responsible for fibrin clot formation. Preclinical animal models have suggested that inhibiting fXa has the potential for providing excellent antithrombotic efficacy with minimal bleeding risk when compared to direct thrombin inhibitors. ${ }^{6 a-g}$ Recent disclosures from clinical studies with direct fXa inhibitors such as compound

$5000 \mathrm{nM}) .{ }^{7 \mathrm{a}}$ Compounds 2 and $\mathbf{4}$ were advanced to clinical trials. Subsequently, compound 4 was further advanced to a phase II trial for the prevention of venous thromboembolism (VTE) after knee replacement surgery and was shown to be highly efficacious when compared to enoxaparin. ${ }^{7 c}$

Consistent with our strategy of developing and advancing key follow-on candidates, our focus was directed toward the identification of novel entities that would be significantly differentiated from previous candidates in terms of improving on potential liabilities of earlier compounds. A common structural feature that is present with compound 4 and its predecessor candidates was the presence of the 5-carboxamido linker that connects the pyrazole scaffold to the $\mathrm{P}_{4}$ moiety. In the advancement of potential candidates for preclinical evaluations, it was necessary to determine the susceptibility of the amide linker to metabolic cleavage because this could potentially liberate a aniline fragment. Fortunately, for compound 4 and its predecessor clinical compound $\mathbf{2}$ the amide linker was stable to metabolic hydrolysis; however, this was not the case with our preclinical compound $\mathbf{3}$, which liberated the biarylamino group at a higher pH . In the bacterial reverse mutation (AMES) ${ }^{13}$ assay, the aniline moiety of $\mathbf{3}$ tested positive, which was further
confirmed in follow-up assays for mutagenicity. ${ }^{14}$ Therefore, as part of our optimization strategy, we sought to modify the carboxamido portion of the molecule to obviate the need for mutagenicity studies on potential aniline degradants. Toward this end, we recently disclosed several series of bicyclic pyrazole scaffolds ${ }^{15 a-c, 16 a}$ in which the carboxamido linker was cyclized into the pyrazole ring, some of which showed similar or better fXa potency compared with the previously disclosed monocyclic pyrazole analogues. ${ }^{7 \mathrm{a}, \mathrm{b}, 11}$ The optimization strategy with the bicyclic pyrazole scaffold led to the identification of BMS740808 (compound 5, fXa $K_{\mathrm{i}}=0.03 \mathrm{nM}$, trypsin $K_{\mathrm{i}}>5000$ nM, Figure 1), ${ }^{15 a}$ which was advanced to preclinical safety evaluation. Importantly, the discovery of the potent bicyclic scaffold set the stage for exploratory work employing additional $P_{1}$ moieties, ${ }^{7 c, 16}$ many of which demonstrated subnanomolar fXa binding affinities and moderate to high clearance ( Cl ) and volume of distribution ( $V_{\mathrm{dss}}$ ) in dogs. However, the lack of adequate differentiation from compound $\mathbf{4}$ in terms of improvement in the overall pharmacokinetic profile made them less attractive for further development. In this paper, we report an optimization strategy that resulted in the identification of compound 40, a structurally novel and neutral bicyclic pyrazole
fXa inhibitor (currently in phase III trials) with a superior pharmacokinetic profile (low clearance and volume of distribution) compared to compound 4.

## Chemistry

The synthesis of the C-3 trifluoromethylpyrazole analogue 6 was accomplished via the cyclization methodology previously described. ${ }^{15,16 a}$ Scheme 1 illustrates the general synthetic methodology utilized to prepare diversified pyrazole C-3 analogues. Commercially available 4-methoxyaniline was diazotized $\left(\mathrm{NaNO}_{2}\right.$, concentrated $\left.\mathrm{HCl}, 0{ }^{\circ} \mathrm{C}\right)$ and condensed in situ with either 1-chloro-1-(methylsulfonyl)propan-2-one or ethyl 2-chloroacetoacetate in the presence of sodium acetate ${ }^{17}$ to provide the requisite $p$-methoxyphenylchlorohydrazones 7a in $57 \%$ yield and $7 \mathbf{b}$ in $90 \%$ yield. Treatment of the chlorohydrazones 7a and $\mathbf{7 b}$ with compound $\mathbf{8}^{15}$ using excess triethylamine afforded the requisite $[3+2]$ cycloadducts which, when treated with TFA in dichloromethane, led to compounds $9 \mathbf{a}$ ( $80 \%$ yield) and 9b ( $71 \%$ yield) respectively. Suzuki coupling of $9 \mathbf{9 a}, \mathrm{~b}$ with 2-formylbenzeneboronic acid as illustrated for compound $\mathbf{5}^{15}$ afforded the biaryl $o$-carboxaldehyde intermediates 10a in 71\% yield and 10b in $80 \%$ yield, respectively. Subsequent reductive amination with $3-(R)$-hydroxypyrrolidine ${ }^{15,16 a}$ provided the bicyclic pyrazole compounds 11a ( $45 \%$ yield) and 11b (69\% yield). Hydrolysis (LiOH in THF and water) of the ester group in 11b gave the desired C-3 carboxylic acid compound 12 in $51 \%$ yield. Compounds $\mathbf{1 3 a}-\mathbf{h}$ were prepared in a two-step sequence by the reductive amination of $\mathbf{1 0 b}$ followed by carboxamide formation as described above in yields that ranged between $80 \%$ and $90 \%$. Alternatively, treatment of compound 11b with ammonium hydroxide in ethanol at $80^{\circ} \mathrm{C}$ for 4 days provided the carboxamidopyrazole analogue $\mathbf{1 3 f}$ in $45 \%$ yield. Hydrolysis ( $\mathrm{NaOH}(1 \mathrm{~N}$ ) in THF/water) of 9b gave carboxylic acid intermediate 14a ( $90 \%$ yield). Treatment of the pyrazole ester $9 \mathbf{b}$ under the Weinreb amide conditions (methylamine or dimethylamine, trimethylaluminum $(1 \mathrm{~N})$ in DCM at $0^{\circ} \mathrm{C}$ to room temperature) ${ }^{18}$ provided $\mathbf{1 4 b}$ ( $92 \%$ yield) and $\mathbf{1 4 c}$ ( $88 \%$ yield). The compounds were subsequently converted to $\mathbf{1 5 a}, \mathbf{b}$ in $55 \%$ and $46 \%$ yield, respectively, following the Suzuki and reductive amination procedures. To prepare the cyanopyrazole compound 18, compound 10b was first converted to the carboxamidobiarylcarboxaldehyde 16 in $66 \%$ yield by treatment with ammonia in methanol at $80^{\circ} \mathrm{C}$. Dehydration (oxalyl chloride in DMF) to 17 ( $42 \%$ yield) followed by reductive amination gave the desired cyano compound $\mathbf{1 8}$ ( $27 \%$ yield).

The aminopyrazole compounds $\mathbf{2 0} \mathbf{- 2 5}$ were accessed according to the methodologies outlined in Scheme 2. Curtius rearrangement ${ }^{19}$ of the pyrazolecarboxylic intermediate 14a provided the Boc protected aminopyrazole intermediate 19a in $22 \%$ yield. Biarylcarboxaldehyde formation (20, $93 \%$ yield) followed by reductive amination with 3-( $R$ )-hydroxypyrrolidine afforded compound 21 in $77 \%$ yield. Treatment of compound 21 with TFA provided compound 22 in $10 \%$ yield. Alternatively, compound 21 was alkylated with sodium hydride and iodomethane in anhydrous DMF to afford 23 in $42 \%$ yield. Treatment of $\mathbf{2 3}$ with TFA in dichloromethane afforded compound 24 in $99 \%$ yield. To prepare compound 25 , pyrazole derivative 19a was deprotected with TFA and reductively aminated with formaldehyde ( $37 \%$ ) and sodium cyanoborohydride in the presence of zinc chloride ( 0.5 M in THF) to afford the dimethylaminopyrazole compound 19b in $51 \%$ yield. Biarylcarboxaldehyde formation followed by reductive amination with $3-(R)$-hydroxypyrrolidine afforded compound $\mathbf{2 5}$ in $34 \%$ yield.
Tetrazolyl compounds 27 and 28 were prepared according to Scheme 3. Treatment of $\mathbf{1 4 b}$ with lutidine and triflic

Scheme 2. Syntheses of 3-Aminopyrazole Analogues ${ }^{a}$

${ }^{a}$ (a) Oxalylchloride, DCM, catalyst DMF; (b) $\mathrm{NaN}_{3}$, water, acetone 0 ${ }^{\circ} \mathrm{C}$; (c) toluene, $80^{\circ} \mathrm{C},{ }^{\mathrm{t}} \mathrm{BuOH}$; (d) TFA, DCM; (e) formaldehyde ( $37 \%$, excess), $\mathrm{ZnCl}_{2}$ ( $0.5 \mathrm{M} / \mathrm{THF}$ ), $\mathrm{NaBH}_{3} \mathrm{CN}, \mathrm{MeOH}$; (f) 2-formylphenylboronic acid, $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4} \mathrm{Pd}, \mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{~N}), 4: 1$ toluene/EtOH, reflux; (g) 3- $(R)$ - $\mathrm{OH}-$ pyrrolidine, $\mathrm{NaCNBH}_{3}, \mathrm{ZnCl}_{2}$ ( 0.5 N , in THF), MeOH ; (h) NaH , DMF, MeI, room temp.
anhydride generated the iminotriflate, which was directly treated with excess sodium azide to give the tetrazole derivative 26 in $48 \%$ yield. Suzuki coupling with 2 -formylboronic acid and reductive amination with 3-(R)-hydroxypyrrolidine led to 27 in $47 \%$ yield. The tetrazole compound 28 was prepared in $52 \%$ yield by heating compound $\mathbf{1 8}$ with sodium azide in DMF.

Heteroarylalkyl compounds 33a-e were synthesized according to procedures outlined in Scheme 4. Borane reduction of carboxylic acid ${ }^{20}$ intermediate 14a afforded the alcohol intermediate 29 in $89 \%$ yield, which was subsequently converted to the bromomethyl intermediate $\mathbf{3 0}$ by treatment with phosphorus tribromide $\left(\mathrm{PBr}_{3}\right)$ in dichloromethane in $94 \%$ yield. Displacement of the crude bromide 30 with 1,2,3-triazole, 1,2,4-triazole, or 1 H -tetrazole afforded mixtures of regioisomeric triazolemethyl or tetrazolylmethyl compounds 31a-e, which were subsequently converted to biarylcarboxaldehyde compounds 32a-e and later to the desired compounds 33a-e.

Variably substituted $P_{4}$ anilino compounds $\mathbf{3 4}, \mathbf{3 5}$, and $\mathbf{3 6 a}-\mathbf{e}$ were prepared according to the methods outlined in Scheme 5. Aryl amination of compound $9 \mathbf{c}$ according to the Buchwald amination methodology ${ }^{21}$ afforded compound 34 in $97 \%$ yield. Acetylation of $\mathbf{3 4}$ with acetic anhydride and triethylamine gave the acetyl derivative $\mathbf{3 5}$ in $97 \%$ yield. Alternatively, aniline 34 was converted to the Boc protected derivative 36a by treatment with Boc anhydride (neat) at $80^{\circ} \mathrm{C}$ in $84 \%$ yield. Alkylation with iodomethane provided $\mathbf{3 6 b}$ in quantitative yield ( $100 \%$ ). Removal of the Boc protecting group afforded 36c was acetylated to afford compound 36d. Alkylation of 36c with idodomethane and potassium carbonate provided compound 36e in $47 \%$ yield.

Scheme 3. Syntheses of C-3-Cyano, 3-Tetrazole Analogues ${ }^{a}$

${ }^{a}$ (a) Triflic anhydride, lutidine, $\mathrm{NaN}_{3}$, DMF; (b) 2-formylphenylboronic acid, $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4} \mathrm{Pd}, \mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{~N}), 4: 1$ toluene/EtOH, $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{~N})$, reflux; (c) 3-( $R$ )-OH-pyrrolidine (2 equiv), $\mathrm{NaCNBH}_{3}, \mathrm{ZnCl}_{2}(0.5 \mathrm{~N}$, in THF), MeOH ; (d) $\mathrm{NaN}_{3}$, DMF, heat.

Analogues in which the $\mathrm{P}_{4}$ moiety is either the phenylpiperidinyl or the corresponding phenyllactam groups were accessed according to the methods outlined in Scheme 6. Ullmann coupling ${ }^{22}\left(\mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{CuI}, 1,10\right.$-phenanthroline in DMSO, $130^{\circ} \mathrm{C}$ ) of compound 9 c with excess piperidine in a sealed tube provided compound 37 in $5 \%$ yield. In a similar manner, the Ullmann coupling of $\mathbf{9 c}$ with $\delta$-valerolactam or caprolactam led to the $\mathrm{P}_{4}$ phenyllactam analogues $\mathbf{3 8 a}, \mathbf{b}$ in $20-25 \%$ yield. Likewise, treatment of pyrazole 9b with $\delta$-valerolactam under similar Ullmann conditions provided compound 39 in $21 \%$ yield, which on aminolysis with ammonia in ethylene glycol at $120{ }^{\circ} \mathrm{C}$ provided compound 40 in $76 \%$ yield.

The preparation of compound 47 is outlined in Scheme 7. Cycloaddition of chlorohydrazone compound 7b and morpholine derivative 42 (prepared in $65 \%$ yield from lactam 41) with triethylamine in toluene under reflux conditions followed by treatment with TFA afforded the bicyclic pyrazole 43 in 75\% yield. Hydrogenation (palladium on carbon in methanol) provided aniline 44 in $96 \%$ yield. Boc protection of $44\left(\mathrm{Boc}_{2} \mathrm{O}\right.$, NaH in THF) followed by alkylation ( NaH and iodomethane) and removal of the Boc group with TFA provided the N -methylaniline derivative $\mathbf{4 5}$ in $56 \%$ yield. Aminolysis of $\mathbf{4 5}$ with ammonia in ethylene glycol at $120^{\circ} \mathrm{C}$ led to compound 46, which was acetylated (acetyl chloride in the presence of sodium hydroxide ( 1 N ) in DCM) to compound 47 in $30 \%$ yield.

## Results and Discussion

Because of the enhancement in potency seen with the tetrahydropyrazolopyridone scaffold, efforts to extend the SAR to include neutral $\mathrm{P}_{1}$ groups such as the $p$-methoxyphenyl that previously showed reduced fXa binding in the monocyclic pyrazole series proved to be successful. ${ }^{16 a-b}$ Although the compounds with this $P_{1}$ group showed potent $f X a$ inhibition in

${ }^{a}$ Compounds were dosed (po/iv) as TFA salts in a cassette dosing N-inone format ${ }^{7 \mathrm{a}, 34 \mathrm{a}-\mathrm{c}}$ at $0.4 \mathrm{mg} / \mathrm{kg}$ iv and at $0.2 \mathrm{mg} / \mathrm{kg}$ po $(n=2) .{ }^{10}$ Caco-2 and $\operatorname{dog}$ PK parameters were measured according to refs 7 a and 11.
(fXa $K_{\mathrm{i}}=0.07 \mathrm{nM}$ ), the nitrile compound 18 (fXa $K_{\mathrm{i}}=$ 0.33 nM ), and the dimethylamino compound 25 (fXa $K_{\mathrm{i}}=$ $0.31 \mathrm{nM})$. The binding affinity and clotting activity of the carboxamide analog $\mathbf{1 3 f}$ showed significant improvement when compared to the corresponding trifluoro-methyl compound $\mathbf{6}$. Compared to the parent carboxamide 13f, the substituted carboxamides $\mathbf{1 5 a}$ and $\mathbf{1 5 b}$, though significantly less potent in the binding assay, were only about 2 - to 3 -fold less potent in the clotting (PT) assay. The ester analogue 11b and its corresponding carboxylic acid $\mathbf{1 2}$ were less potent in both assays. Among the C-3 amino analogues investigated, the order of fXa potency was $\mathrm{NMe}_{2}>\mathrm{NHMe} \geq \mathrm{N}(\mathrm{Me}) \mathrm{Boc} \geq \mathrm{NH}_{2}$, NHBoc. The unsubstituted amino analogue 22 and the $N$-methylamino compound $\mathbf{2 4}$ demonstrated acceptable activity in the clotting
assay. Amongst the tetrazole analogs, the tetrazole compound 27 showed moderate clotting activity, though less potent in the binding assay, and the reverse was true for tetrazole 28. Triazolylmethyl and tetrazolylmethyl analogues 33a-d exhibited good potencies in both assays. Overall, the compounds shown in Table 1 were highly selective ( $>1000$-fold) for fXa relative to other serine proteases such as thrombin and trypsin.

Table 2 lists the pharmacokinetic profile in dogs of a representative set of the most optimized C-3 substituted compounds. The carboxamide $\mathbf{1 3 f}$ demonstrated an excellent pharmacokinetic profile, with low clearance ( $\mathrm{Cl}=0.32 \mathrm{~L} \mathrm{~kg}^{-1} \mathrm{~h}^{-1}$ ), moderate volume of distribution ( $V_{\mathrm{dss}}=1.6 \mathrm{~L} \mathrm{~kg}^{-1}$ ), and a half-life ( $T_{1 / 2}$ ) of 5.6 h . The high oral bioavailability $(F=100 \%)$ exhibited by $\mathbf{1 3 f}$ was consistent with the high apparent permeability ( $P_{\text {app }}$ $=2.3 \times 10^{-6} \mathrm{~cm} \mathrm{~s}^{-1}$ ) of this compound in the Caco-2 assay. ${ }^{23}$ In contrast, the pharmacokinetic profiles of the triazole analogue 33a and the 1,2,3,4-tetrazole analogue 33d were poor with high clearance, moderate volume of distribution, and poor oral bioavailability.

Given the excellent fXa activity exhibited by compound $\mathbf{1 3 f}$ and its high oral bioavailability, we shifted the focus on further $\mathrm{P}_{4}$ optimization (Table 3). In general, the compounds retained subnanomolar fXa binding affinity and potent clotting activity, good selectivity (trypsin/thrombin, >100-fold), and showed good permeability ( $P_{\text {app }}$ ) in the Caco-2 assay. The unsubstituted amino compound 13a ( $\mathrm{fXa} K_{\mathrm{i}}=0.97 \mathrm{nM}$ ) was the least potent, whereas the substituted amino compounds $\mathbf{1 3 b} \mathbf{- d}$ exhibited

[^1]potent fXa inhibitory activity (fXa $K_{\mathrm{i}}<0.3 \mathrm{nM}$ ) and good clotting activity ( $\mathrm{PT} \mathrm{EC} 2 \times 1.5 \mu \mathrm{M}$ ). As was observed with the $3-(R)$-hydroxypyrrolidine compound $\mathbf{1 3 f}$, the 4-hydroxypiperidinyl analogue 13g also demonstrated low clearance, moderate volume of distribution, and half-life in the same range as observed with 13f. Again, the high dog oral bioavailability seen for $\mathbf{1 3 g}(F=55 \%)$ correlated well with the observed Caco-2 ( $P_{\text {app }}$ ) permeability value. In the rabbit arteriovenous shunt (AVShunt) thrombosis model, ${ }^{69}$ compounds $\mathbf{1 3 b}, \mathbf{1 3 c}, \mathbf{1 3 f}$, and 13 g inhibited thrombus formation in a dose-dependent manner with $\mathrm{IC}_{50}$ values of $445,175,120$, and 180 nM , respectively, and with the exception of $\mathbf{1 3 b}$ were slightly more potent than compound 4 (AVShunt $\left.\mathrm{IC}_{50}=340 \mathrm{nM}\right)^{7 \mathrm{a}}$ and were in the same range when compared to compound 5 (AVShunt $\mathrm{IC}_{50}=140$ $\mathrm{nM}) .{ }^{15 \mathrm{a}}$ Of the compounds in this series, 13b had the longest half-life in dogs, albeit with relatively high clearance and high volume of distribution. Interestingly, these data did not correlate well with the observed 13b half-life in the human liver microsome (HLM) assay ${ }^{24}\left(T_{1 / 2}>100 \mathrm{~min}\right)$. In the same assay, the HLM half-life for compounds $\mathbf{4}$ and $\mathbf{5}$ was 38 and 42 min, respectively. Taken together therefore, the carboxamide pyrazole analogue $\mathbf{1 3 f}$ emerged as a potent alternative to compound 4, with excellent potency both in vitro and in vivo and a good pharmacokinetic profile in dogs.

In a parallel effort, the compounds containing $\mathrm{P}_{4}$ nitrogen atom (as the point of attachment) were also explored (Table 4). ${ }^{12 \mathrm{c}}$ This strategy proved to be highly successful in that a potent compound 36d bearing a $N$-methylacetyl group was quickly identified. This discovery was significant in that it differed in structure from all our previous pendent $\mathrm{P}_{4}$ groups we had explored. The compound, though more potent than the aniline derivatives 34, 36c, and 36e, was weak in the clotting assay, suggesting high protein binding. The high level of potency exhibited by compound $\mathbf{3 6 d}$ ( $\mathrm{fXa} K_{\mathrm{i}}=0.50 \mathrm{nM}$ ) suggested that the orientation of the $\mathrm{P}_{4} \mathrm{~N}$-methylacetyl substituent in the $\mathrm{S}_{4}$ region of the fXa active site is very important. This type of observation was unique in the fXa literature at the time it was discovered. To explain this finding, a closer look at the model of $\mathbf{3 6 d}$ in the active site of fXa clearly showed the $N$-methyl $\mathrm{P}_{4}$ group forming a lipophilic $\pi$ interaction with the bottom $\mathrm{S}_{4}$ Trp215 residue, ${ }^{12 \mathrm{~d}}$ and thus positioning the acetyl carbonyl functionality perpendicular to the inner $P_{4}$ phenyl ring, thereby forming a hydrophobic interaction with the other residues in this region. The importance of the orientation of the $N$-methyl group was confirmed by the loss in fXa affinity with the acetamide analogue 35 (fXa $K_{\mathrm{i}}=180 \mathrm{nM}$ ) where the planarity of this group positioned it in an unfavorable orientiation in the $\mathrm{S}_{4}$ region of the enzyme. The dimethylamino analogue 36e (fXa $K_{\mathrm{i}}=6.0 \mathrm{nM}$ ) and piperidinyl 37 (fXa $K_{\mathrm{i}}=2.1 \mathrm{nM}$ ) were also less potent, suggesting a planar orientation with these moieties in the $\mathrm{S}_{4}$ region as well. Cyclization of the $\mathrm{P}_{4} N$-methyl acetyl group in $\mathbf{3 6 d}$ to form lactam analogues $\mathbf{3 8 a}$ and $\mathbf{3 8 b}$ retains the subnanomolar fXa binding affinity. Unfortunately, lactam analogues 38a $(\mathrm{PT}=23 \mu \mathrm{M})$ and $\mathbf{3 8 b}(\mathrm{PT}=26 \mu \mathrm{M})$ exhibited poor anticoagulant activity. This could be explained by the high lipophilicity ( $c \log \mathrm{P}>7$ ) and high human serum protein binding ( $>99 \%)^{25}$ exhibited by these compounds.

In order to modulate the lipophilicity of $\mathbf{3 6 d}$ and $\mathbf{3 8 a}$, we reintroduced the polar C-3 carboxamido moiety (Table 5) that was shown to be important in compounds $\mathbf{1 3 a} \mathbf{- h}$. The carboxamidopyrazole analogue 40 (fXa $K_{\mathrm{i}}=0.08 \mathrm{nM}$, $\mathrm{PT}=3.8$ $\mu \mathrm{M})$ and $47\left(\mathrm{fXa} K_{\mathrm{i}}=0.61 \mathrm{nM}, \mathrm{PT}=3.1 \mu \mathrm{M}\right)$ not only maintained subnanomolar fXa binding affinity but also demonstrated much improved potency in the clotting (PT) assay,

especially when compared to the related trifluoromethylpyrazole analogues 38a and 36d.

Selectivity and Liability Profiling. Compound $\mathbf{4 0}$ shows a high degree of selectivity versus other proteases (see supplemental section), even compared to compounds $\mathbf{4}^{7 \mathrm{a}}$ and $5 .{ }^{15 \mathrm{a}}$ Additionally, the compound shows weak activity against various $\mathrm{P}_{450}$ isozymes $\left(\mathrm{IC}_{50}>25 \mu \mathrm{M}\right)$ and weak activity against the hERG potassium channel $\left(\mathrm{IC}_{50}>25 \mu \mathrm{M}\right.$, patch clamp assay). ${ }^{26 a-\mathrm{e}}$ The solubility of compound $\mathbf{4 0}$ was shown to be approximately $40-50 \mu \mathrm{~g} / \mathrm{mL} .{ }^{27}$ In the human liver microsome assay, compound 40 was very stable with a $T_{1 / 2}$ of $>100 \mathrm{~min}$ (the HLM $T_{1 / 2}$ of $\mathbf{4 7}$ was not measured). The Caco- 2 permeability values for compounds $40\left(P_{\text {app }}=0.9 \times 10^{-6} \mathrm{~cm} \mathrm{~s}^{-1}\right)$ and $47\left(P_{\text {app }}=\right.$ $2.5 \times 10^{-6} \mathrm{~cm} \mathrm{~s}^{-1}$ ) were moderate to high.

Dog Pharmacokinetics and Rabbit Antithrombotic Efficacy. As a result of the excellent in vitro potency and selectivity of compounds 40 and $\mathbf{4 7}$, the pharmacokinetic profiles of both compounds were studied in dogs using a cassette dosing paradigm ("N-in-one" study, Table 6). ${ }^{7 \mathrm{a}, 34 \mathrm{a}, \mathrm{b}}$ The acetylated $N$-methyl analogue 47 was orally bioavailable; but showed high clearance $\left(\mathrm{Cl}=2.8 \mathrm{~L} \mathrm{~kg}^{-1} \mathrm{~h}^{-1}\right)$, moderate volume of distribution ( $V_{\mathrm{dss}}=1.7 \mathrm{~L} \mathrm{~kg}^{-1}$ ), and unacceptable half life. The dog pharmacokinetics for compound $\mathbf{4 0}$ was outstanding with very low clearance $\left(\mathrm{Cl}=0.02 \mathrm{~L} \mathrm{~kg}^{-1} \mathrm{~h}^{-1}\right)$, and low volume of distribution $\left(\mathrm{V}_{\mathrm{dss}}=0.2 \mathrm{~L} \mathrm{~kg}^{-1}\right)$. These values were significantly

lower than those observed with compounds $\mathbf{4}$ and 5. FXa being a vascular target, the pharmacokinetic profile for compound $\mathbf{4 0}$ was viewed as highly desirable and less likely to have nontargetrelated adverse effects. Importantly, compound 40 had a moderate half-life ( $T_{1 / 2}=5.8 \mathrm{~h}$ ) and good oral bioavailability ( $F=58 \%$ ). The human serum protein binding as measured by equilibrium dialysis for $\mathbf{4 0}$ was $87 \%{ }^{25}$ In the rabbit AVShunt thrombosis model (Figure 4), compound 40 inhibited thrombus formation in a dose-dependent manner with an $\mathrm{IC}_{50}$ value of $329 \mathrm{nM} .{ }^{15 \mathrm{~d}, \mathrm{e}}$ This is comparable to the antithrombotic potency obtained for compound $4\left(\mathrm{IC}_{50}=340 \mathrm{nM}\right)$ in the same model.

X-ray Crystallography of Compound 40. The X-ray structure for compound 40 bound to fXa (Figure 2, $2.3 \AA$ resolution with an $R$ value of 0.229 and an $R_{\text {free }}$ of 0.277 ) shows a tight inhibitor-enzyme complex ${ }^{30-33}$ and shows a similar binding mode compared to compound $2^{11}$ and $4 .^{7 \text { a }}$ The $p$ methoxy group in the $S_{1}$ specificity pocket does not appear to interact with any specific residue in this region of the enzyme, and is oriented in a planar manner relative to the phenyl $\mathrm{P}_{1}$ moiety. Other interactions that were found to be similar to those observed for compounds $\mathbf{4}^{7 \mathrm{a}}$ and $\mathbf{5}^{15 \mathrm{a}}$ included the pyrazole N -2 nitrogen atom interaction with the backbone of Gln 192 ( $3.2 \AA$ ) and the carbonyl oxygen (scaffold carboxamide) interaction with the NH of Gly216 ( $2.9 \AA$ ). The pyrazole C-3 carboxamido moiety shows the NH within bonding distance to the Glu146 carbonyl oxygen ( $3.1 \AA$ ) with the carbonyl oxygen solvent exposed. The orientation of the pendant $\mathrm{P}_{4}$ phenyllactam of $\mathbf{4 0}$ in the $S_{4}$ region shows an edge to face interaction with $\operatorname{Trp} 215$ and is appropriately positioned between the Tyr99 and Phe174

Figure 2. X-ray structure of fXa bound to compound 40. Atomic coloring is used with cyan for fXa cartoon and carbon atoms and gray for compound 40 carbon atoms. Water molecules are shown as red spheres. Initial electron density $\left(2 F_{\mathrm{o}}-F_{\mathrm{c}}\right.$ contoured at $1 \sigma$ ) is shown in magenta. Hydrogen bonds between protein and ligand are shown as dashed black lines. The figure was created using PyMol. ${ }^{35}$
residues. The X-ray structure does not appear to show the carbonyl oxygen group of the pendent lactam moiety directly interacting with any residues in the $\mathrm{S}_{4}$ pocket but appears to show it interacting with a water molecule. Importantly, the $\mathrm{P}_{4}$ lactam carbonyl brings about a conformational bias toward

orthogonality to optimally position itself between the $\mathrm{S}_{4}$ enzyme residues Trp215, Tyr99, and Phe174. Overall, compound 40 fits into the fXa enzyme active site in a highly complementary manner. Figure 3 shows an overlay of the X-ray structures of the fXa-bound compounds 40 and 4.

## Conclusions

Several bicyclic pyrazolopyridinone analogues bearing the p-methoxyphenyl $\mathrm{P}_{1}$ moiety have been identified with potent inhibitory activity against coagulation fXa. A diverse set of $\mathrm{C}-3$ substituents were identified that retained potent fXa activity and possessed good clotting (PT) activity. Most optimal in terms of in vitro potency and potency in the clotting assay is the C-3 carboxamido pyrazole moiety. Combination of this moiety with the relatively polar and neutral lactam $\mathrm{P}_{4}$ moiety resulted in compound $\mathbf{4 0}$, with high metabolic stability, ultralow clearance, and low volume of distribution. Compound 40 is a potent, selective, and orally bioavailable fXa inhibitor that demonstrates antithrombotic efficacy similar to compound 4 in the rabbit arteriovenous shunt thrombosis model (Figure 4). Importantly, compound 40 (apixaban, BMS-562247) is a significant improvement when compared to compound 4 based on its excellent pharmacokinetic profile and has been advanced to human clinical trials for the prevention and treatment of venous and arterial thrombosis.

## Experimental Section

All reactions were run under an atmosphere of dry nitrogen unless otherwise noted. Solvents and reagents were obtained from commercial vendors in the appropriate grade and used without further purification unless otherwise indicated. NMR spectra $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{19} \mathrm{~F}\right)$ were obtained on VXR or Unity 300 MHz instruments (Varian Instruments, Palo Alto, CA) with chemical shift in ppm downfield from TMS as an internal reference standard. ${ }^{1} \mathrm{H}$ assignment abbreviations are as follows: singlet (s), doublet (d), triplet (t), quartet $(\mathrm{q})$, pentet $(\mathrm{p})$, broad singlet (bs), doublet of doublets (dd), doublet of triplets (dt), and multiplet (m). Elemental analyses were performed by Quantitative Technologies, Inc., Whitehouse, NJ, and were within $0.4 \%$ of the theoretical values. Mass spectra were measured with a HP 5988A mass spectrometer with a particle beam interface using $\mathrm{NH}_{3}$ for chemical ionization or a Finnigan MAT 8230 mass spectrometer with $\mathrm{NH}_{3}$-DCI or VG TRIO 2000 for ESI. High-resolution mass spectra were measured on a VG 70-VSE instrument with $\mathrm{NH}_{3}$ ionization. Flash chromatography was carried out using EM Science silica gel 60 (230-400 mesh). Preparative thin layer chromatography was done on EM Science 60 plates $\mathrm{F}_{254}$ ( $2 \mathrm{~mm}, 20 \mathrm{~cm} \times 20 \mathrm{~cm}$ ). HPLC purification was performed on a Jasco 900 series instrument or a Rainin Dynamax SD200 using a C 18 reverse-phase column with acetonitrile $/ \mathrm{H}_{2} \mathrm{O}$ (containing $0.05 \%$ TFA) as a mobile phase. All compounds were found to be $>95 \%$ pure by HPLC analysis unless otherwise noted.

X-ray Crystallographic Studies. The factor Xa /compound 40 crystals were obtained from GLA-Domainless $\beta$-Factor Xa (Haematologic Technologies) that had been fractionated on a Amersham mono-Q 10/10 column equilibrated with 50 mM Tris, $\mathrm{pH} 8.0,100 \mathrm{mM} \mathrm{NaCl}$, and $1 \mathrm{mM} \mathrm{CaCl} 2_{2}$ and eluted with a 20-bed volume gradient from 0 to 500 mM NaCl . Inhibitor was added to the fractions as they were collected. Protein of interest eluted at about 100 mM NaCl . This solution was incubated for 12 h and concentrated to $6 \mathrm{mg} / \mathrm{mL}$ using a Vivaspin 6 mL concentrator with a 5000 MWCO membrane. The crystals were grown at $4^{\circ} \mathrm{C}$ using hanging drop vapor diffusion, with $18 \%$ PEG 6000 and 200 mM $\mathrm{NaOAc}(\mathrm{pH} 5.5)$ in the reservoir. Hanging drops contained $4 \mu \mathrm{~L}$ of protein solution and $4 \mu \mathrm{~L}$ of reservoir solution. The drops were microseeded with a crushed crystal from a previous crystal growth. Cryoprotectant was introduced to the factor Xa crystals by first transferring the crystals to a $2 \mu \mathrm{~L}$ drop of the soaking solution and then bridging the small drop into a $20 \mu \mathrm{~L}$ drop of solution containing $22 \%$ PEG 200, buffered with 200 mM Na acetate ( pH 5.5 ) and $20 \%$ ethylene glycol. After about a minute in this solution, the crystals were frozen. Data for the $\mathrm{fXa} / 40$ complex were collected at the DuPont-Northwestern-Dow Collaborative Access Team (DND-CAT) located at Sector 5 of the Advanced Photon Source (APS). DND-CAT is supported by E.I. DuPont de Nemours \& Co., The Dow Chemical Company and the State of Illinois. Use of the APS was supported by the U. S. Department of Energy, Office of Science, Office of Basic Energy Sciences, under Contract No. DE-

AC02-06CH11357. Data were collected at a wavelength of $1.0 \AA$ at 100 K using an Oxford cryosystems cooling device. Data frames of $1^{\circ}$ rotation were collected. Data were $99 \%$ complete. Raw data were processed with the program HKL. ${ }^{30}$ The program EPMR ${ }^{31}$ was used to determine the initial model for refinement using the PDB coordinates 1FJS (minus the inhibitor and solvent molecules) as the search model. The CNX (Accelrys) program was used for crystallographic refinement. Simulated annealing (at a maximum temperature of 3000 K ) was followed by $B$-factor refinement. The inhibitor was built with the program QUANTA (Accelrys). Peaks in the difference electron density map that were greater than $3 \sigma$ and that were less than $4 \AA$ away from the protein were built in as solvent molecules. No major adjustments to the protein model were needed during the course of the refinements. Final $R$ values as well as other relevant data collection statistics are found in Supporting Information. Coordinates for the enzyme inhibitor structure have been deposited with the Protein Data Bank with the code 2P16.

Enzyme Affinity Assays. All enzyme $K_{\mathrm{i}}$ values were obtained from purified human enzymes. All fXa assays were run in microtiter plates using a total volume of $250 \mu \mathrm{~L}$ in 0.1 M sodium phosphate buffer containing 0.2 M NaCl and $0.5 \%$ polyethylene glycol 6000 at pH 7.0 . The compounds were run at $10,3.16,1.0,0.316,0.1$, $0.0316,0.01$, and $0.00316 \mu \mathrm{M}$. Plates were read for 30 min at 405 nm . Rates were determined in the presence of the controls (no inhibitor) and for the inhibitors. Percent enzyme activity was determined from these rates and used in the following formula to determine $K_{\mathrm{i}}$ :

$$
K_{\mathrm{i}}=\frac{\text { InhibitorConcentration }}{\frac{K_{\mathrm{m}}+S-S^{*} \mathrm{ACT}}{\mathrm{ACT}^{*} K_{\mathrm{m}}}-1}
$$

where $S$ is the substrate concentration and ACT is the fraction of percent enzyme activity for inhibitor rates. All compounds were tested in duplicate studies and were compared with the same internal standards. The intraassay and interassay variabilities are $5 \%$ and $20 \%$, respectively. These assays are described in detail in refs 28 and 29. All of the enzyme assays were conducted in pH 7.4 buffer at room temperature. All enzymes were purified from human tissues and were obtained from commercially available sources. Individual enzyme and substrate $K_{\mathrm{m}}$ were determined in separate experiments and were close to values established in the literature. Steady-state inhibition of enzyme activity was determined by incubating a range of inhibitor concentrations ( 1 nM to $50 \mu \mathrm{M}$, in duplicate) with fixed enzyme $(0.1-100 \mathrm{nM})$ and peptide substrate (200-1000 $\mu \mathrm{M})$ concentration for up to 30 min . The $K_{\mathrm{i}}$ was calculated, assuming competitive inhibition and one-site binding, either from the $\mathrm{IC}_{50}$ or from the extent of inhibition at each inhibitor concentration.

In Vitro Coagulation Assays (PT/APTT). Standard clotting assays were performed in a temperature-controlled automated coagulation device (Sysmex 6000, Dade-Behring). Blood was obtained from healthy volunteers by venipuncture and anticoagulated with $1 / 10$ volume of 0.11 M buffered sodium citrate (Vacutainer, Becton Dickinson). Plasma was obtained after centrifugation at 2000 g for 10 min and kept on ice prior to use. An initial stock solution of the inhibitor at 10 mM was prepared in DMSO. Subsequent dilutions were done in plasma. Plasma solutions containing inhibitor were kept on ice prior to assay. Clotting time was determined on control plasma and plasma containing five to seven different concentrations of inhibitor. Determinations at each plasma concentration were done in duplicate. The clotting time at each concentration was compared with the control clotting time for each pooled plasma. The prothrombin time test was performed using Dade Thromboplastin C Plus according to the reagent instructions. Plasma ( $50 \mu \mathrm{~L}$ ) was warmed to $37^{\circ} \mathrm{C}$ for 3 min before adding Dade Thromboplastin C Plus $(100 \mu \mathrm{~L})$. The activated partial thromboplastin time (aPTT) was performed using AlexinTM (Sigma Diagnostics) according to the reagent instructions. Plasma ( $50 \mu \mathrm{~L}$ ) was warmed to $37{ }^{\circ} \mathrm{C}$ for 1 min before adding aPTT reagent ( 50 $\mu \mathrm{L}$ ). Three minutes later calcium chloride ( $50 \mu \mathrm{~L}$ ) was added.

Dog "N-in-One" Pharmacokinetic Study. Pharmacokinetic study protocols were approved by the site Animal Care and Use Committee. Compounds were dissolved in $N, N$-dimethylacetamide (DMAC) to a concentration of $20 \mathrm{mg} / \mathrm{mL}$. Compounds were combined in a final dosing solution containing $0.2 \mathrm{mg} / \mathrm{mL}$ of each compound in 10:10:10:70 \% v/v DMAC/ethanol/propylene glycol/ water. Beagle dogs were administered $2.5 \mathrm{~mL} \mathrm{~kg}^{-1} \mathrm{~h}^{-1}$ for 1 h by intravenous infusion or 1 mL kg -1 by oral gavage. At timed intervals, blood samples were drawn into ${ }^{1 / 10}$ volume of $3.2 \%$ sodium citrate and placed on ice. Plasma was obtained after centrifuging blood at 2000 g for 10 min at 4 C . Urine was collected up to 24 h after dosing. Plasma and urine were frozen on dry ice and stored at $-70{ }^{\circ} \mathrm{C}$ for later analysis. Samples from the pharmacokinetic studies were analyzed with LC-MS/MS methods. High-throughput technologies such as the turbulent-flow columnswitching technique and direct plasma sample injection were applied to some studies. In general, the analytical methods were specific and sensitive with a quantification level of 1 nM . The intraday variability was less than $30 \%$. Average run time was about 6 min for each sample. ${ }^{34 \mathrm{a}-\mathrm{c}}$

Syntheses. Preparation of (Z)- $N^{\prime}$-(4-Methoxyphenyl)-1-(methylsulfonyl)methanehydrazonoyl Chloride (7a). To $p$-anisidine 7 $(4.39 \mathrm{~g}, 3.6 \mathrm{mmol})$ in concentrated $\mathrm{HCl}(9.2 \mathrm{~mL})$ and water (20 $\mathrm{mL})$ at $0^{\circ} \mathrm{C}$ was slowly added sodium nitrite $(2.58 \mathrm{~g}, 3.7 \mathrm{mmol})$ in water $(20 \mathrm{~mL})$. The mixture was stirred cold $\left(-5^{\circ} \mathrm{C}\right)$ for 0.5 h . The above mixture was poured into a mixture of commercially available 3-chloromethanesulphonylacetone ( $6.1 \mathrm{~g}, 3.5 \mathrm{mmol}$ ), acetone ( 50 mL ), sodium acetate ( $6.7 \mathrm{~g}, 8.2 \mathrm{mmol}$ ), and water ( 100 mL ). The mixture was stirred 4 h at room temperature. The precipitate was filtered off and dried to afford the desired product 7a as a red solid $(5.28 \mathrm{~g}, 57 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 8.05(\mathrm{~s}, 1 \mathrm{H})$, $7.12(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.91(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H})$, $3.23(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm}$. The product obtained was used as is in the [3+2] cycloaddition step.

Preparation of (Z)-Ethyl 2-Chloro-2-(2-(4-methoxyphenyl)hydrazono)acetate (7b). p-Anisidine ( $16 \mathrm{~g}, 0.129 \mathrm{~mol}$ ) was dissolved in a solution of concentrated $\mathrm{HCl}(40 \mathrm{~mL})$ and water ( 100 mL ) and cooled to $-5^{\circ} \mathrm{C}$. To this solution was added dropwise an aqueous solution $\left(\mathrm{H}_{2} \mathrm{O}, 60 \mathrm{~mL}\right)$ of sodium nitrite $(9.4 \mathrm{~g}, 0.136$ $\mathrm{mol})$ so as to maintain the temperature below $-5^{\circ} \mathrm{C}$. Once the addition was complete, the diazotized product was stirred for 20 $\min$ at $0^{\circ} \mathrm{C}$ followed by the sequential addition of ethyl chloroacetoacetate ( $22 \mathrm{~g}, 0.133 \mathrm{~mol}$ ), ethanol ( 100 mL ), sodium acetate $(32 \mathrm{~g}, 0.389 \mathrm{~mol})$, and water $(400 \mathrm{~mL})$. The reaction mixture was gradually warmed to room temperature and stirred for an additional 2 h . At this point the product that precipitated as a black solid was filtered, washed with excess water, and dried in vacuo to afford the desired product ( $30 \mathrm{~g}, 90 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 8.28$ (s, $1 \mathrm{H}), 7.18(\mathrm{~d}, J=9.1 \mathrm{~Hz}, 2 \mathrm{H}), 6.90(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H}), 4.41(\mathrm{q}$, $J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 1.42(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}) \mathrm{ppm}$. The crude product obtained by this methodology was used as is in the $[3+2]$ cycloaddition step.

Preparation of 6-(4-Iodophenyl)-1-(4-methoxyphenyl)-3-(meth-ylsulfonyl)-1,4,5,6-tetrahydro-7H-pyrazolo[3,4-c]pyridin-7-one (9a). Compound $7 \mathbf{7 a}(2.60 \mathrm{~g}, 10 \mathrm{~mol})$ was stirred with morpholine compound $8(3.80 \mathrm{~g}, 10 \mathrm{~mol})$, triethylamine ( $2.76 \mathrm{~mL}, 20 \mathrm{~mol}$ ), and toluene $(30 \mathrm{~mL})$. The reaction mixture was heated at $70{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 12 h and cooled to $5^{\circ} \mathrm{C}$, and $\mathrm{HCl}(4 \mathrm{~N}, 12.4 \mathrm{~mL})$ was added dropwise. The cooling bath was removed, and the mixture was stirred at room temperature for 4 h . Hexane ( 5 mL ) and water $(10 \mathrm{~mL})$ were added. The precipitate formed was filtered, washed with water and hexane, and dried to afford $4.15 \mathrm{~g}(80 \%)$ of the desired product 9a. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.71(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H})$, $7.47(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H})$, $6.95(\mathrm{~d}, J=9.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.13(\mathrm{t}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H})$, $3.36(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.31(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm}$. LRMS $m / z 523.9$ $(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of Ethyl 6-(4-Iodophenyl)-1-(4-methoxyphenyl)-7-oxo-4,5,6,7-tetrahydro-1 H -pyrazolo[3,4-c]pyridine-3-carboxylate ( $\mathbf{9 b}$ ). To toluene ( 400 mL ) was added compound $\mathbf{7 b}$ ( 30 g , $0.117 \mathrm{~mol})$, compound $8(29.9 \mathrm{~g}, 0.078 \mathrm{~mol})$, and triethylamine
$(74 \mathrm{~mL}, 0.53 \mathrm{~mol})$, and the mixture was gently heated at the reflux temperature for 24 h . The reaction mixture was cooled, quenched with water $(200 \mathrm{~mL})$, extracted with ethyl acetate $(2 \times 200 \mathrm{~mL})$, washed with brine $(100 \mathrm{~mL})$, and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Evaporation of the solvent afforded a black oil, which was directly purified by silica gel column chromatography (1:1 hexane/ethyl acetate). The cycloadduct morpholine intermediate obtained was directly treated with trifluoroacetic acid ( 50 mL ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(500 \mathrm{~mL})$ for 24 h . The reaction mixture was concentrated and quenched with water $(100 \mathrm{~mL})$, and the organics were extracted with ethyl acetate $(2 \times$ $100 \mathrm{~mL})$, washed with brine $(100 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated to the desired compound, which was pure enough for the next step $(28.8 \mathrm{~g}, 71 \%) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.70(\mathrm{~d}, J=$ $8.80 \mathrm{~Hz}, 2 \mathrm{H}), 7.46(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2$ $\mathrm{H}), 6.92(\mathrm{~d}, J=9.20 \mathrm{~Hz}, 2 \mathrm{H}), 4.49(\mathrm{q}, J=6.90 \mathrm{~Hz}, 2 \mathrm{H}), 4.12(\mathrm{t}$, $J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}) \mathrm{ppm}$. LRMS $m / z 517.9(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of $4^{\prime}$-[3-Methanesulfonyl-1-(4-methoxyphenyl)-7-oxo-1,4,5,7-tetrahydropyrazolo[3,4-c]pyridin-6-yl]biphenyl-2carbaldehyde (10a). To the methylsulfone pyrazole 9a (0.41 g, 0.78 mmol ), 2-formylbenzeneboronic acid ( $0.18 \mathrm{~g}, 1.10 \mathrm{mmol}$ ), and $2 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3}(0.8 \mathrm{~mL} 1.4 \mathrm{mmol})$ were added toluene $(30 \mathrm{~mL})$ and EtOH ( 20 mL ). After the mixture was degassed with $\mathrm{N}_{2}$, tetrakistriphenylphosphinepalladium(0) $(0.05 \mathrm{~g}, 0.004 \mathrm{mmol})$ was added and the mixture was heated at the reflux temperature for 24 h . The mixture was cooled and concentrated. The residue was dissolved in $\mathrm{EtOAc}(50 \mathrm{~mL})$, washed with water $(25 \mathrm{~mL})$ and brine $(25 \mathrm{~mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. Purification by chromatography on silica gel with $1: 1$ hexanes/EtOAc afforded $0.28 \mathrm{~g}(80 \%)$ of aldehyde $\mathbf{1 0 a}$ as a gray solid. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 9.99(\mathrm{~s}, 1 \mathrm{H}), 8.04(\mathrm{~m}, 1 \mathrm{H})$, $7.67(\mathrm{dt}, J=1.40,7.30 \mathrm{~Hz}, 1 \mathrm{H}), 7.53(\mathrm{~m}, 1 \mathrm{H}), 7.50(\mathrm{~d}, J=9.20$ $\mathrm{Hz}, 2 \mathrm{H}), 7.44(\mathrm{~m}, 5 \mathrm{H}), 6.96(\mathrm{~d}, J=9.20 \mathrm{~Hz}, 2 \mathrm{H}), 4.24(\mathrm{t}, J=$ 6.60 Hz, 2H), $3.83(\mathrm{~s}, 3 \mathrm{H}), 3.41(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.33(\mathrm{~s}, 3 \mathrm{H})$ ppm. ESIMS $m / z 524.0(\mathrm{M}+\mathrm{Na})^{+}$.

Preparation of Ethyl 6-(2'-Formylbiphenyl-4-yl)-1-(4-meth-oxyphenyl)-7-oxo-4,5,6,7-tetrahydro-1H-pyrazolo[3,4-c]pyridine-3-carboxylate (10b). To the pyrazole ester $9 \mathrm{~b}(2.1 \mathrm{~g}, 4.0 \mathrm{mmol})$, was added 2-formylbenzeneboronic acid ( $0.91 \mathrm{~g}, 6.1 \mathrm{mmol}$ ), 2 M $\mathrm{Na}_{2} \mathrm{CO}_{3}(4 \mathrm{~mL}, 8.0 \mathrm{mmol})$, toluene $(50 \mathrm{~mL})$, and $\mathrm{EtOH}(10 \mathrm{~mL})$. The mixture was degassed with nitrogen for 0.25 h followed by the addition of tetrakis(triphenylphosphine)palladium(0) (0.1 g, 0.09 mmol ), and the reaction mixture was heated at the reflux temperature for 24 h . The mixture was cooled and concentrated in vacuo. The residue was dissolved in $\mathrm{EtOAc}(50 \mathrm{~mL})$ and washed with water and brine $(50 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Purification by silica gel chromatography ( $1: 1$ hexanes/EtOAc) afforded the title biarylaldehyde compound $\mathbf{1 0 b}(1.6 \mathrm{~g}, 80 \%)$ as an orange solid. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 9.97(\mathrm{~s}, 1 \mathrm{H}), 8.03(\mathrm{dd}, J=1.10,7.70 \mathrm{~Hz}, 1 \mathrm{H}), 7.66$ $(\mathrm{dt}, J=1.10,7.30 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{~m}, 2 \mathrm{H}), 7.50(\mathrm{~d}, J=8.80 \mathrm{~Hz}$, $2 \mathrm{H}), 7.43(\mathrm{~d}, J=9.80 \mathrm{~Hz}, 2 \mathrm{H}), 7.42(\mathrm{~m}, 2 \mathrm{H}), 6.94(\mathrm{~d}, J=8.80$ $\mathrm{Hz}, 2 \mathrm{H}), 4.51(\mathrm{q}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.43(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.81$ $(\mathrm{s}, 3 \mathrm{H}), 3.39(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 1.46(\mathrm{t}, J=7.30 \mathrm{~Hz}, 3 \mathrm{H}) \mathrm{ppm}$. ESIMS m/z $496.18(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of (R)-6-(2'-((3-Hydroxypyrrolidin-1-yl)methyl)-biphenyl-4-yl)-1-(4-methoxyphenyl)-3-(methylsulfonyl)-5,6-dihy-dro-1H-pyrazolo[3,4-c $]$ pyridin-7(4H)-one (11a). To the biarylcarboxaldehyde intermediate $10 \mathrm{a}(96 \mathrm{mg}, 0.19 \mathrm{mmol}$ ) in MeOH $(4 \mathrm{~mL})$ was added $3-(R)$-pyrrolidinol ( $50 \mathrm{mg}, 0.57 \mathrm{mmol}$ ), and the mixture was stirred for 15 min . A solution of $0.5 \mathrm{M} \mathrm{ZnCl}_{2}$ in THF $(0.19 \mathrm{~mL})$ and sodium cyanoborohydride ( $12 \mathrm{mg}, 0.19 \mathrm{mmol}$ ) were added sequentially, and the reaction mixture was stirred at room temperature for 24 h . The mixture was concentrated, and the residue was quenched with water ( 25 mL ). The aqueous layer was extracted with EtOAc $(2 \times 25 \mathrm{~mL})$, washed with water $(25 \mathrm{~mL})$ and brine $(25 \mathrm{~mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. Filtration, concentration, and purification by reverse-phase HPLC (acetonitrile/water/0.05\% TFA) followed by lyophilization of the pure fraction afforded the title compound 11a as a colorless solid ( $61 \mathrm{mg}, 46.9 \%$ ). HPLC purity, $>95 \%$. ${ }^{1} \mathrm{H}$ NMR (MeOD) $\delta: 7.57$ (bs, 1H), 7.45-7.41 (m, 6 H$)$, $7.29(\mathrm{~m}, 3 \mathrm{H}), 6.93(\mathrm{~d}, J=9.09 \mathrm{~Hz}, 2 \mathrm{H}), 4.47(\mathrm{~m}, 1 \mathrm{H}), 4.34$ $(\mathrm{m}, 2 \mathrm{H}), 4.13(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 3.49(\mathrm{~m} 2 \mathrm{H})$,

ESIMS m/z $538.12(\mathrm{M}+\mathrm{H})^{+}$. HRMS calculated for $\mathrm{C}_{31} \mathrm{H}_{32} \mathrm{~N}_{5} \mathrm{O}_{4}(\mathrm{M}+\mathrm{H})^{+} 538.2454$; found 538.2456.

Preparation of 6-(4-Iodophenyl)-1-(4-methoxyphenyl)-7-oxo-4,5,6,7-tetrahydro-1H-pyrazolo[3,4-c]pyridine-3-carboxylic Acid (14a). To a methanol ( 15 mL ) and THF $(20 \mathrm{~mL})$ solution of the
pyrazole ester compound $9 \mathbf{b}(12 \mathrm{~g}, 23.0 \mathrm{mmol})$ was added 1 N $\mathrm{NaOH}(25 \mathrm{~mL})$, and the mixture was stirred for 24 h . The organic solvents were stripped, and the aqueous solution was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 100 \mathrm{~mL})$. The aqueous layer was acidified with concentrated HCl and extracted with $\mathrm{EtOAc}(2 \times 100 \mathrm{~mL})$. The EtOAc layer was dried with $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated to a brown solid $(10.2 \mathrm{~g}, 90 \%) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.68(\mathrm{~d}, J=8.40 \mathrm{~Hz}$, $2 \mathrm{H}), 7.49(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 7.10(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 6.91$ $(\mathrm{d}, J=8.70 \mathrm{~Hz}, 2 \mathrm{H}), 4.12(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.34$ ( $\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}$ ) ppm. ESIMS $m / z 490.26(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of 6-(4-Iodophenyl)-1-(4-methoxyphenyl)- $N$ -methyl-7-oxo-4,5,6,7-tetrahydro-1H-pyrazolo[3,4-c]pyridine-3carboxamide (14b). To a cold $\left(0^{\circ} \mathrm{C}\right)$ solution of methylamine ( 2 M in THF, $0.64 \mathrm{~mL}, 1.29 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added trimethylaluminum ( 2 M in toluene, $0.64 \mathrm{~mL}, 1.29 \mathrm{mmol}$ ), and the reaction mixture was stirred cold for 0.25 h . To this solution was added compound $9 \mathbf{b}(0.16 \mathrm{~g}, 0.32 \mathrm{mmol})$, and the reaction mixture was gradually allowed to warm to room temperature and stirred at this temperature for 72 h . The reaction was quenched with HCl $(1 \mathrm{~N}, 50 \mathrm{~mL})$, and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50$ $\mathrm{mL})$, washed with brine $(50 \mathrm{~mL})$, and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Filtration followed by purification via silica gel column chromatography (EtOAc/hexanes, 1:4) afforded compound 14b (53 mg, 92\%). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.66(\mathrm{~d}, J=8.59 \mathrm{~Hz}, 2 \mathrm{H}), 7.45(\mathrm{~d}, J=8.84$ $\mathrm{Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, J=8.59 \mathrm{~Hz}, 2 \mathrm{H}), 6.95(\mathrm{~d}, J=8.84 \mathrm{~Hz}, 2 \mathrm{H})$, $4.09(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.40(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H})$ ppm. ESIMS m/z $518.0(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of 6-(4-Iodophenyl)-1-(4-methoxyphenyl)- $\mathrm{N}, \mathrm{N}$ -dimethyl-7-oxo-4,5,6,7-tetrahydro-1H-pyrazolo[3,4-c]pyridine-3-carboxamide (14c). To a cold $\left(0^{\circ} \mathrm{C}\right)$ dimethylamine ( 2 M in THF, $0.68 \mathrm{~mL}, 1.3 \mathrm{mmol}$ ) solution were added $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and trimethylaluminum ( 2 M in toluene, $0.68 \mathrm{~mL}, 1.3 \mathrm{mmol}$ ), and the mixture was stirred cold for 0.25 h . To this cold solution was added compound $9 \mathbf{b}(0.17 \mathrm{~g}, 0.34 \mathrm{mmol})$, and the mixture was gradually allowed to warm to room temperature and stirred at this temperature for 72 h . The reaction mixture was quenched with HCl $(1 \mathrm{~N})$, and the organics were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50 \mathrm{~mL})$, washed with brine $(50 \mathrm{~mL})$, and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Filtration, concentration, and purification via silica gel chromatography using (EtOAc/hexanes, 9:1, as eluent) afforded the desired compound 14c (0.154 g, 88\%). ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.68(\mathrm{~d}, J=8.58 \mathrm{~Hz}, 2 \mathrm{H})$, $7.46(\mathrm{~d}, J=8.84 \mathrm{~Hz}, 2 \mathrm{H}), 7.09(\mathrm{~d}, J=8.55 \mathrm{~Hz}, 2 \mathrm{H}), 6.93(\mathrm{~d}, J=$ $8.84 \mathrm{~Hz}, 2 \mathrm{H}), 4.09(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.44(\mathrm{~s}, 3 \mathrm{H})$, $3.30(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.13(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm}$. Preparation of tert-Butyl 6-(4-Iodophenyl)-1-(4-methoxyphen-yl)-7-oxo-4,5,6,7-tetrahydro-1 H -pyrazolo [3,4-c $]$ pyridin-3-ylcarbamate (19a). To a $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25 \mathrm{~mL})$ solution of the pyrazole acid $\mathbf{1 4 b}$ ( 1.19 $\mathrm{g}, 2.4 \mathrm{mmol})$ were added oxalyl chloride ( $0.3 \mathrm{~mL}, 3.4 \mathrm{mmol}$ ) and 2 drops of DMF, and the reaction mixture was stirred at room temperature for 24 h . The mixture was concentrated and then dissolved in acetone ( 20 mL ) and added to a cold $\left(0^{\circ} \mathrm{C}\right)$ solution of $\mathrm{NaN}_{3}(0.47 \mathrm{~g}, 7.3 \mathrm{mmol})$ in water $(20 \mathrm{~mL})$. After 20 min the acylazide was extracted with EtOAc $(2 \times 25 \mathrm{~mL})$, washed with brine ( 25 mL ), and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. The acylazide intermediate was dissolved in toluene ( 20 mL ) and heated gently at $80^{\circ} \mathrm{C}$ for 1 h . To this hot solution was then syringed in tert-butyl alcohol $(25 \mathrm{~mL})$, and the reaction mixture was heated at $80^{\circ} \mathrm{C}$ for an additional 24 h . The reaction mixture was cooled, concentrated, and partitioned between EtOAc ( 25 mL ) and water ( 25 mL ). The layers were separated, and the aqueous layer was further extracted with EtOAc ( 25 mL ) and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Purification via silica gel column chromatography ( $2: 1$ hexanes/EtOAc as eluent) afforded the title compound 19a as a tan foam $(0.3 \mathrm{~g}, 22 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.68(\mathrm{~d}, J=8.40 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{~d}, J=9.20 \mathrm{~Hz}, 2 \mathrm{H})$, $7.08(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.91(\mathrm{~d}, J=9.20 \mathrm{~Hz}, 2 \mathrm{H}), 6.75(\mathrm{~s}, 1 \mathrm{H})$, $4.07(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 3.15(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H})$, $1.52(\mathrm{~s}, 9 \mathrm{H}) \mathrm{ppm}$. ESIMS $\mathrm{m} / \mathrm{z} 561.2(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of 3-(Dimethylamino)-6-(4-iodophenyl)-1-(4-methoxyphenyl)-5,6-dihydro-1H-pyrazolo[3,4-c]pyridin-7(4H)one (19b). To a $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ solution of 19a $(0.45 \mathrm{~g}, 0.80$ $\mathrm{mmol})$ was added TFA $(4 \mathrm{~mL})$, and the reaction mixture was stirred for 24 h at room temperature. The solvents were evaporated under high vacuum to dryness. The crude deprotected pyrazole amine was dissolved in $\mathrm{MeOH} / \mathrm{THF}(1: 1,6 \mathrm{~mL})$. To this solution was added formaldehyde ( $37 \%$ in water, $0.24 \mathrm{~mL}, 2.40 \mathrm{mmol}$ ), and the mixture was stirred for 15 min . Then zinc chloride in THF ( 0.5 M , $0.8 \mathrm{~mL}, 0.4 \mathrm{mmol}$ ) was added followed by sodium cyanoborohydride ( $50 \mathrm{mg}, 0.80 \mathrm{mmol}$ ), and the reaction mixture was stirred for 24 h . The solvent was evaporated, and the residue was dissolved in EtOAc ( 100 mL ), washed with water ( 50 mL ) and brine ( 50 $\mathrm{mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. Purification by silica gel column chromatography ( $1: 1$ hexanes/ethyl acetate as eluent) afforded the desired product 19b as a yellow foam $(0.20 \mathrm{~g}, 51 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.66(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 7.42(\mathrm{~d}, J=4.04 \mathrm{~Hz}, 2 \mathrm{H})$, 7.08 (d, $J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 6.89(\mathrm{~d}, J=9.10 \mathrm{~Hz}, 2 \mathrm{H}), 4.05(\mathrm{t}, J=$ $6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.78(\mathrm{~s}, 3 \mathrm{H}), 3.06(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 2.91(\mathrm{~s}, 6 \mathrm{H})$ ppm. ESIMS m/z $489.2(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of tert-Butyl 6-(2'-Formylbiphenyl-4-yl)-1-(4-methoxyphenyl)-7-oxo-4,5,6,7-tetrahydro-1H-pyrazolo[3,4-c]-pyridin-3-ylcarbamate (20). To a toluene ( 20 mL ) and EtOH $(10 \mathrm{~mL})$ solution were added compound 19a $(0.30 \mathrm{~g}, 0.53$ mmol ), 2-formylbenzeneboronic acid ( $0.12 \mathrm{~g}, 8.0 \mathrm{mmol}$ ), and 2 M $\mathrm{Na}_{2} \mathrm{CO}_{3}(1.1 \mathrm{~mL}, 2.0 \mathrm{mmol})$. The reaction mixture was degassed with nitrogen for 0.25 h , followed by the addition of tetrakistriphenylphosphinepalladium ( $30 \mathrm{mg}, 0.03 \mathrm{mmol}$ ). The reaction mixture was heated at the reflux for 24 h , cooled, and concentrated in vacuo. The resulting residue was dissolved in EtOAc ( 50 mL ), washed with water $(25 \mathrm{~mL})$ and brine $(25 \mathrm{~mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. Purification by silica gel chromatography ( $1: 1$ hexanes/ EtOAc) afforded the title compound 20 as a yellow solid ( $27 \mathrm{~g}, 93 \%$ ). HPLC purity, $>95 \% .^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 10.11(\mathrm{~s}, 1 \mathrm{H}), 8.03(\mathrm{dd}, J=$ $1.1,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.64(\mathrm{dt}, J=1.4,7.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.49(\mathrm{t}, J=7 \mathrm{~Hz}$, $1 \mathrm{H}), 7.42(\mathrm{~m}, 7 \mathrm{H}), 6.92(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.79(\mathrm{~s}, 1 \mathrm{H}), 4.17$ $(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.17(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.53$ ( $\mathrm{s}, 9 \mathrm{H}$ ) ppm. ESIMS $m / z 539.29(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of (R)-3-Amino-6-(2'-((3-hydroxypyrrolidin-1-yl)-methyl)biphenyl-4-yl)-1-(4-methoxyphenyl)-5,6-dihydro-1Hpyrazolo $[3,4-c]$ pyridin- $\mathbf{7 ( 4 H )}$-one (22). To the pyrazole intermediate $20(58 \mathrm{mg}, 0.10 \mathrm{mmol})$ were added $\mathrm{MeOH}(3 \mathrm{~mL})$ and $3-(R)$ pyrrolidinol $(0.132 \mathrm{~g}, 0.10 \mathrm{mmol})$, and the mixture was stirred for 15 min . Zinc chloride ( 0.5 M in $\mathrm{THF}, 0.1 \mathrm{~mL}, 0.05 \mathrm{mmol}$ ) was added followed by sodium cyanoborohydride ( $7 \mathrm{mg}, 0.10 \mathrm{mmol}$ ), and the reaction mixture was stirred at room temperature for 24 h . The solvent was evaporated in vacuo, and the residue was dissolved in EtOAc ( 25 mL ), washed with water ( 25 mL ) and brine ( 25 mL ), and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Purification by reverse-phase HPLC (acetonitrile/water/0.05\%TFA gradient) followed by freeze-drying afforded compound 21 as a colorless solid ( $60 \mathrm{mg}, 77 \%$ ). HPLC purity, $>95 \% .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.90(\mathrm{~m}, 1 \mathrm{H}), 7.50-7.42(\mathrm{~m}$, $7 \mathrm{H}), 7.27$ (m, 1H), 7.24 (d, $J=8.10 \mathrm{~Hz}, 2 \mathrm{H}), 6.93(\mathrm{~d}, J=8.80$ $\mathrm{Hz}, 2 \mathrm{H}), 6.90(\mathrm{~s}, 1 \mathrm{H}), 6.80(\mathrm{~s}, 1 \mathrm{H}), 4.45(\mathrm{~m}, 3 \mathrm{H}), 4.14(\mathrm{t}, J=6.60$ $\mathrm{Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.75(\mathrm{~m}, 1 \mathrm{H}), 3.45(\mathrm{~m}, 1 \mathrm{H}), 3.20(\mathrm{t}, J=$ $6.60 \mathrm{~Hz}, 2 \mathrm{H}), 2.6-2.10(\mathrm{~m}, 3 \mathrm{H}), 1.53(\mathrm{~s}, 9 \mathrm{H}) \mathrm{ppm}$. ESIMS $\mathrm{m} / \mathrm{z}$ $610.12(\mathrm{M}+\mathrm{H})^{+}$. HRMS calculated for $\mathrm{C}_{35} \mathrm{H}_{40} \mathrm{~N}_{5} \mathrm{O}_{5}(\mathrm{M}+\mathrm{H})^{+}$ 610.3025 ; found 610.3025 . Compound $21(20 \mathrm{mg}, 0.03 \mathrm{mmol})$ was dissolved in dichloromethane ( 20 mL ), and to this solution was added TFA $(0.5 \mathrm{~mL})$. The reaction mixture was stirred at room temperature for 1 h . The solution was concentrated in vacuo, and the residue was directly purified directly via reverse-phase HPLC (acetonitrile/water/0.05\%TFA). Lyopilization of the pure fraction afforded the desired product 22 as a colorless solid ( $1.5 \mathrm{mg}, 10 \%$ ). HPLC purity, >95\%. ${ }^{1} \mathrm{H}$ NMR (MeOD) $\delta: 7.45$ (m, 1H), 7.44$7.27(\mathrm{~m}, 9 \mathrm{H}), 6.85(\mathrm{~d}, J=9.10 \mathrm{~Hz}, 2 \mathrm{H}), 4.35-4.29(\mathrm{~m}, 2 \mathrm{H}), 4.07$ $(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.39-3.29(\mathrm{~m}, 3 \mathrm{H}), 3.08(\mathrm{~m},-$ $1 \mathrm{H}), 2.87(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 2.06-1.78(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm}$. Preparation of 3-(Hydroxymethyl)-6-(4-iodophenyl)-1-(4-methoxyphenyl)-5,6-dihydro-1H-pyrazolo[3,4-c]pyridin-7(4H)one (29). To a cold $\left(0^{\circ} \mathrm{C}\right) \mathrm{THF}(30 \mathrm{~mL})$ solution was added pyrazole 3-carboxylic acid derivative $\mathbf{1 4 a}(4.66 \mathrm{~g}, 9.50 \mathrm{mmol})$ followed by the addition of borane tetrahydrofuran solution ( 1 M , $14.0 \mathrm{~mL}, 14.0 \mathrm{mmol})$. The mixture was allowed to stir at room temperature for 18 h and quenched with $\mathrm{AcOH}(0.5 \mathrm{~mL})$ and water $(20 \mathrm{~mL})$. The layers were separated, and the aqueous layer was extracted with EtOAc $(2 \times 75 \mathrm{~mL})$. The combined organic layers were washed with brine $(50 \mathrm{~mL})$ and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Filtration and concentration afforded compound 29 (4 g, 89\%). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.68(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.44(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H})$, $7.09(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.92(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.79(\mathrm{~s}, 2 \mathrm{H})$, $4.10(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 3.09(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H})$ ppm. ESIMS $m / z 476.16(\mathrm{M}+\mathrm{H})^{+}$.

Preparation of 3-(Bromomethyl)-6-(4-iodophenyl)-1-(4-meth-oxyphenyl)-5,6-dihydro-1H-pyrazolo[3,4-c]pyridin-7(4H)-one (30). To a suspension of alcohol $29(3 \mathrm{~g}, 6.30 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50$ $\mathrm{mL})$, was added $\mathrm{PBr}_{3}(0.89 \mathrm{~mL}, 8.8 \mathrm{mmol})$ dropwise. The mixture was stirred at room temperature for 1 h , quenched with cold $\left(0^{\circ} \mathrm{C}\right)$ water $(100 \mathrm{~mL})$, extracted with $\mathrm{CHCl}_{3}(2 \times 50 \mathrm{~mL})$, washed with brine $(50 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated in vacuo to afford the desired product $30(3.2 \mathrm{~g}, 94 \%) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta$ : $7.69(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.45(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, J=$ $8.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.58(\mathrm{~s}, 2 \mathrm{H}), 4.13(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H})$, $3.08(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}) \mathrm{ppm}$. The crude material obtained was used directly in the next reaction.

Preparation of 3-((1H-1,2,3-Triazol-1-yl)methyl)-6-(4-iodophen-yl)-1-(4-methoxyphenyl)-5,6-dihydro-1H-pyrazolo[3,4-c]pyri-din-7(4H)-one (31a) and 3-((2H-1,2,3-Triazol-2-yl)methyl)-6-(4-iodophenyl)-1-(4-methoxyphenyl)-5,6-dihydro-1H-pyrazolo[3,4-c]pyridin-7(4H)-one (31b). To DMF ( 5 mL ) was added $1 H-1,2,3-$ triazole $(0.1 \mathrm{~mL}, 2.0 \mathrm{mmol})$ and $\mathrm{NaH}(0.1 \mathrm{~g}, 2.56 \mathrm{mmol})$ followed by the pyrazole bromide $30(0.92 \mathrm{~g}, 1.7 \mathrm{mmol})$. The mixture was gently heated to $50^{\circ} \mathrm{C}$ for 24 h , cooled, quenched with water ( 25 $\mathrm{mL})$, and extracted with ethyl acetate $(2 \times 25 \mathrm{~mL})$. The organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated to the desired product as a mixture of isomers 31a and 31b $(89 \mathrm{mg})$. ESIMS $\mathrm{m} / \mathrm{z}$. $527.1(\mathrm{M}+\mathrm{H})^{+}$. The crude product containing the isomeric triazoles were carried to the next step without purification.

Preparation of $(R)-3-((1 H-1,2,3-T r i a z o l-1-y l) m e t h y l)-6-\left(2^{\prime}-\right.$ ((3-hydroxypyrrolidin-1-yl)methyl)biphenyl-4-yl)-1-(4-meth-oxyphenyl)-5,6-dihydro-1H-pyrazolo[3,4-c]pyridin-7(4H)-one (33a) and $(R)$-3-((2H-1,2,3-Triazol-2-yl)methyl)-6-(2'-((3-hydroxypyr-rolidin-1-yl)methyl)biphenyl-4-yl)-1-(4-methoxyphenyl)-5,6-di-hydro-1H-pyrazolo[3,4-c]pyridin-7(4H)-one (33b). To the crude mixture of isomeric triazoles 31a and 31b $(0.89 \mathrm{~g}, 1.70 \mathrm{mmol})$ were added 2-formylbenzeneboronic acid ( $0.38 \mathrm{~g}, 2.6 \mathrm{mmol}$ ), 2 M $\mathrm{Na}_{2} \mathrm{CO}_{3}(1.7 \mathrm{~mL}, 3.4 \mathrm{mmol})$, toluene $(30 \mathrm{~mL})$, and $\mathrm{EtOH}(10 \mathrm{~mL})$. The reaction mixture was vigorously stirred and degassed with nitrogen for 0.25 h , followed by the addition of tetrakis-triphenylphosphinepalladium catalyst ( $58 \mathrm{mg}, 0.03 \mathrm{mmol}$ ). The reaction mixture was heated at reflux for 24 h , cooled, and concentrated in vacuo. The residue was dissolved in $\mathrm{EtOAc}(50 \mathrm{~mL})$, washed with water $(25 \mathrm{~mL})$ and brine $(25 \mathrm{~mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. Purification by silica gel column chromatography (1:3 hexanes/EtOAc as eluent) afforded the isomeric triazole biarylcarboxaldehyde intermediates 32a,b. The triazole biarylcarboxaldehyde derivatives were subjected to reductive amination with $3-(R)$-pyrrolidinol, zinc chloride, and sodium cyanoborohydride in anhydrous THF ( 10 mL ) as previously described, to obtain after reverse-phase HPLC purification (acetonitrile/water/0.05\% TFA) and lyophilization the desired product 33a
as a colorless solid ( $20 \mathrm{mg}, 28 \%$ ). HPLC purity, $>95 \% .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{DMSO}-d_{6}\right) \delta: 8.24(\mathrm{~d}, J=1.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.78(\mathrm{~d}, J=1.10 \mathrm{~Hz}$, $1 \mathrm{H}), 7.76(\mathrm{~m}, 1 \mathrm{H}), 7.53(\mathrm{~m}, 6 \mathrm{H}), 7.38(\mathrm{~d}, J=8.50 \mathrm{~Hz}, 2 \mathrm{H}), 7.33$ $(\mathrm{m}, 1 \mathrm{H}), 6.99(\mathrm{~d}, J=8.70 \mathrm{~Hz}, 2 \mathrm{H}), 5.77(\mathrm{~s}, 2 \mathrm{H}), 4.49(\mathrm{~d}, J=5.90$ $\mathrm{Hz}, 1 \mathrm{H}), 4.38(\mathrm{~m}, 1 \mathrm{H}), 4.28(\mathrm{~m}, 1 \mathrm{H}), 4.10(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H})$, $3.79(\mathrm{~s}, 3 \mathrm{H}), 3.60-2.90(\mathrm{~m}, 3 \mathrm{H}), 2.91(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 2.10-$ $1.75(\mathrm{~m}, 3 \mathrm{H}) \mathrm{ppm}$. Preparation of 6-(4-(Dimethylamino)phenyl)-1-(4-methoxy-phenyl)-3-(trifluoromethyl)-5,6-dihydro-1H-pyrazolo[3,4-c]py-ridin-7(4H)-one (36e). Compound $\mathbf{3 6 c}(0.25 \mathrm{~g}, 0.62 \mathrm{mmol})$ was dissolved in DMF ( 2 mL ), followed by the addition of potassium carbonate $(1 \mathrm{~g}, 7.24 \mathrm{mmol})$ and iodomethane $(1 \mathrm{~mL})$. The reaction mixture was capped and stirred at room temperature for 24 h , then quenched with water ( 25 mL ). The organic material was extracted with $\mathrm{EtOAc}(2 \times 25 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated to an oil. The compound was purified via reverse-phase HPLC (acetonitrile/water/0.05\% TFA), and lyophilization of the desired fraction afforded 36e as a colorless solid ( $0.125 \mathrm{~g}, 47 \%$ ). HPLC purity, $>95 \% .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.66(\mathrm{bs}, 1 \mathrm{H}), 7.49(\mathrm{~m}, 4 \mathrm{H})$, $7.20(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.90(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 4.15(\mathrm{t}, 2 \mathrm{H})$, $3.81(\mathrm{~s}, 3 \mathrm{H}), 3.18(\mathrm{~s}, 6 \mathrm{H}), 3.17(\mathrm{t}, 2 \mathrm{H}) \mathrm{ppm}$. ESIMS m/z $431(\mathrm{M}+$ $\mathrm{H})^{+}$. HRMS calculated for $\mathrm{C}_{25} \mathrm{H}_{22} \mathrm{~F}_{3} \mathrm{~N}_{4} \mathrm{O}_{2}(\mathrm{M}+\mathrm{H})^{+}$431.4289; found 431.4280.

Preparation of 1-(4-Methoxyphenyl)-6-(4-(piperidin-1-yl)-phenyl)-3-(trifluoromethyl)-5,6-dihydro-1H-pyrazolo[3,4-c]py-ridin-7(4H)-one (37). In a sealed tube was added DMSO (1 mL), piperidine $(0.5 \mathrm{~mL})$, compound $9 \mathrm{c}(0.2 \mathrm{~g}, 0.38 \mathrm{mmol})$, potassium carbonate $(0.16 \mathrm{~g}, 1.16 \mathrm{mmol}), 1,10$-phenanthroline $(0.001 \mathrm{~g})$, and copper iodide $(0.005 \mathrm{~g})$. The mixture was sealed and heated at $130^{\circ} \mathrm{C}$ for 24 h , cooled, and quenched with water ( 50 mL ). The organics were extracted with ethyl acetate $(2 \times 50 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$, and evaporated to a brown oil. Purification via reversephase HPLC followed by lyophilization of the pure fraction afforded the desired product 37 as a colorless solid ( $9 \mathrm{mg}, 5 \%$ ). HPLC purity, $>95 \%$. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.63(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.49(\mathrm{~m}$, $4 \mathrm{H}), 6.96(\mathrm{~d}, J=9.5 \mathrm{~Hz}, 2 \mathrm{H}), 4.19(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.84(\mathrm{~s}$, $3 \mathrm{H}), 3.50(\mathrm{~m}, 4 \mathrm{H}), 3.23(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.15(\mathrm{~m}, 4 \mathrm{H}), 1.77$ (m, 2H) ppm. ESIMS $m / z 471.27(\mathrm{M}+\mathrm{H})^{+}$. HRMS calculated for $\mathrm{C}_{25} \mathrm{H}_{26} \mathrm{~F}_{3} \mathrm{~N}_{4} \mathrm{O}_{2}(\mathrm{M}+\mathrm{H})^{+} 471.2008$; found 471.1980.

Preparation of 1-(4-Methoxyphenyl)-6-(4-(2-oxopiperidin-1-yl)phenyl)-3-(trifluoromethyl)-5,6-dihydro-1H-pyrazolo[3,4-c]-pyridin-7(4H)-one (38a). The pyrazole derivative 9c (0.08 g, 0.16 $\mathrm{mmol})$ was dissolved in DMSO $(1 \mathrm{~mL})$, and to this solution was added $\delta$-valerolactam $(0.05 \mathrm{~g}, 0.47 \mathrm{mmol}), 1,10$-phenanthroline $(1 \mathrm{mg})$, and $\mathrm{K}_{2} \mathrm{CO}_{3}(0.07 \mathrm{~g}, 0.47 \mathrm{mmol})$. The reaction mixture was degassed for 0.5 h followed by the addition of $\mathrm{CuI}(1 \mathrm{mg})$ and heated to $130{ }^{\circ} \mathrm{C}$ for 24 h . The reaction mixture was quenched with water $(50 \mathrm{~mL})$, and the organics were extracted with ethyl acetate $(2 \times 50 \mathrm{~mL})$, washed with water $(50 \mathrm{~mL})$, and dried $\left(\mathrm{MgSO}_{4}\right)$. The solvent was concentrated to a tan solid, which was dissolved in methanol and purified directly via reverse-phase HPLC (acetonitrile/water/0.05\% TFA gradient), and lyophilization afforded the desired product 38a as a colorless solid ( $15 \mathrm{mg}, 20 \%$ ). HPLC purity, $>95 \% .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.50(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 2 \mathrm{H})$, $7.37(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.28(\mathrm{~d}, J=9.1 \mathrm{~Hz}, 2 \mathrm{H}), 6.97(\mathrm{~d}, J=$ $9.2 \mathrm{~Hz}, 2 \mathrm{H}), 4.18(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.85(\mathrm{~s}, 3 \mathrm{H}), 3.02(\mathrm{t}, J=7.6$ $\mathrm{Hz}, 2 \mathrm{H}), 3.20(\mathrm{t}, J=3.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.65(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.01$ $(\mathrm{m}, 4 \mathrm{H}) \mathrm{ppm}$. ESIMS $m / z 508.2(\mathrm{M}+\mathrm{Na})^{+}$. HRMS calculated for $\mathrm{C}_{25} \mathrm{H}_{24} \mathrm{~F}_{3} \mathrm{~N}_{4} \mathrm{O}_{3}(\mathrm{M}+\mathrm{H})^{+} 485.1801$; found 485.1810. Anal. Calcd for $\mathrm{C}_{25} \mathrm{H}_{23} \mathrm{~F}_{3} \mathrm{~N}_{5} \mathrm{O}_{3}$ : C, 61.98, H, 4.79, N, 11.56. Found: C, 61.88, H, 4.88, N, 11.67.

Preparation of 1-(4-Methoxyphenyl)-6-(4-(2-oxoazepan-1-yl)-phenyl)-3-(trifluoromethyl)-5,6-dihydro-1H-pyrazolo[3,4-c]py-ridin- $\mathbf{7}(\mathbf{4 H})$-one ( $\mathbf{3 8 b}$ ). The title compound $\mathbf{3 8 b}$ was prepared following the Ullmann procedure employed for compound 38a, by reacting compound $9 \mathrm{c}(0.08 \mathrm{~g}, 0.16 \mathrm{mmol})$ with azepan-2-one ( 0.05 $\mathrm{g}, 0.47 \mathrm{mmol})$ and potassium carbonate $(0.07 \mathrm{~g}, 0.47 \mathrm{mmol})$ in the presence of catalytic $\mathrm{CuI}(1 \mathrm{mg})$ in DMSO $(1 \mathrm{~mL})$. A colorless solid was obtained after purification via reverse-phase HPLC (22 $\mathrm{mg}, 25 \%$ yield). HPLC purity, $>95 \%$. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 7.45$ $(\mathrm{d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.28(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.24(\mathrm{~d}, J=6.8 \mathrm{~Hz}$, $2 \mathrm{H}), 6.91(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.11(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.79(\mathrm{~s}$, $3 \mathrm{H}), 3.72(\mathrm{~m}, 2 \mathrm{H}), 3.14(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.71(\mathrm{~m}, 2 \mathrm{H}), 1.81$ $(\mathrm{m}, 6 \mathrm{H}) \mathrm{ppm}$. ESIMS $m / z 499.16(\mathrm{M}+\mathrm{H})^{+}$. HRMS calculated for $\mathrm{C}_{26} \mathrm{H}_{26} \mathrm{~F}_{3} \mathrm{~N}_{4} \mathrm{O}_{3}(\mathrm{M}+\mathrm{H})^{+} 499.1875$; found 499.1866. Anal. Calcd for $\mathrm{C}_{26} \mathrm{H}_{25} \mathrm{~F}_{3} \mathrm{~N}_{5} \mathrm{O}_{3}$ : C, 62.64, H, 5.05, N, 11.24. Found: C, 62.50, H, 5.11, N, 11.39.

Preparation of 1-(4-Methoxyphenyl)-7-oxo-6-[4-(2-oxo-1-pi-peridinyl)phenyl-4,5,6,7-tetrahydro- 1 H -pyrazole-[3,4-c]pyridine-3-carboxamide (40). To the pyrazole compound 9b (25 g, 0.048 mol ) was added $\delta$-valerolactam $(6.7 \mathrm{~g}, 0.067 \mathrm{~mol}), \mathrm{K}_{2} \mathrm{CO}_{3}(8 \mathrm{~g}$, $58.0 \mathrm{mmol})$, and DMSO ( 100 mL ). The reaction mixture was degassed with nitrogen for 0.5 h followed by the addition of CuI $(1.84 \mathrm{~g}, 9.0 \mathrm{mmol})$. The mixture was heated to $130^{\circ} \mathrm{C}$ for 24 h , cooled, and quenched with water $(50 \mathrm{~mL})$. The organics were extracted with EtOAc $(2 \times 100 \mathrm{~mL})$ and dried $\left(\mathrm{MgSO}_{4}\right)$. Purification by silica gel column chromatography ( $\mathrm{MeOH} / \mathrm{DCM}, 1: 9$, as eluent) afforded the intermediate 39 as a tan foam ( $5 \mathrm{~g}, 21 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.49(\mathrm{~d}, J=9.20 \mathrm{~Hz}, 2 \mathrm{H}), 7.35(\mathrm{~d}, J=8.80$ $\mathrm{Hz}, 2 \mathrm{H}), 7.26(\mathrm{~d}, J=8.10 \mathrm{~Hz}, 2 \mathrm{H}), 6.92(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H})$, $4.49(\mathrm{q}, J=7.30 \mathrm{~Hz}, 2 \mathrm{H}), 4.13(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H})$, $3.59(\mathrm{~m}, 2 \mathrm{H}), 3.39(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 2.55(\mathrm{~m}, 2 \mathrm{H}), 1.91(\mathrm{~m}$, $4 \mathrm{H}), 1.45(\mathrm{t}, J=7.30 \mathrm{~Hz}, 3 \mathrm{H}) \mathrm{ppm}$. ESIMS m/z $477(\mathrm{M}+\mathrm{H})^{+}$. To the ester intermediate $39(4.8 \mathrm{~g}, 0.009 \mathrm{~mol})$ was added $5 \% \mathrm{NH}_{3}$ in ethylene glycol ( 40 mL ), and the mixture was heated to $120^{\circ} \mathrm{C}$ for 4 h in a sealed vessel. The mixture was cooled, and the reaction was quenched with water ( 50 mL ). The solid was precipitated, filtered, and dried under vacuum. Purification by silica gel column chromatography $\left(\mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 9\right.$, as eluent) afforded the desired product 40 as a colorless solid ( $3.5 \mathrm{~g}, 76 \%$ ). HPLC purity, $>95 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 7.49(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 7.37(\mathrm{~d}, J=9.10$ $\mathrm{Hz}, 2 \mathrm{H}), 7.26(\mathrm{~d}, J=8.80 \mathrm{~Hz}, 2 \mathrm{H}), 6.98(\mathrm{~s}, 1 \mathrm{H}), 6.95(\mathrm{~d}, J=9.20$ $\mathrm{Hz}, 2 \mathrm{H}), 6.28(\mathrm{~s}, 1 \mathrm{H}), 4.14(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.61$ $(\mathrm{m}, 2 \mathrm{H}), 3.39(\mathrm{t}, J=6.60 \mathrm{~Hz}, 2 \mathrm{H}), 2.63(\mathrm{t}, J=6.20 \mathrm{~Hz}, 2 \mathrm{H}), 1.96$ $(\mathrm{m}, 4 \mathrm{H})$ ppm. Acknowledgment. The authors thank Ms. Joanne Smallheer, Dr. James Corte, Dr. Mimi Quan, Ms. Erin Austin, Dr. Martin

Ogletree, and Dr. William Ewing for proofreading this manuscript. The authors also thank Dr. Lynn Abell, Mr. Jeffrey Bozarth, Mr. Andrew Leamy, and Ms. Tracy Bozarth for their help in generating various enzyme data and key pharmacodynamic measurements such as the PT/APTT and the hep test. The authors also thank Mr. Earl Crain and Ms. Carol Watson for their tireless efforts in generating rabbit in vivo data. Dr. Steven Sheriff is thanked for preparing and depositing the X-ray structure coordinates of and data for compound $\mathbf{4 0}$ in fXa into the PDB and for his help in preparing Figures 2 and 3. The authors would like to thank Dr. Paul S. Anderson for his support and encouragement of the factor Xa program.

Supporting Information Available: Complete experimental procedures for compounds $\mathbf{6}, \mathbf{4 1 - 4 7}$, and 13a-e,g-h and Table 8 detailing the enzyme selectivity profile of compound $\mathbf{4 0}$ compared to its predecessor compounds $\mathbf{4}$ and $\mathbf{5}$. This material is available free of charge via the Internet at http://pubs.acs.org.

[^1]:    ${ }^{a} K_{\mathrm{i}}$ values were obtained from purified human enzymes and are averaged from two experiments ( $n=2$ ). ${ }^{28,29}$ Prothrombin time (PT) values are measured according to refs 7 a and 11 . Human trypsin $K_{\mathrm{i}}$ values for all compounds listed in Table 2 are $>3000 \mathrm{nM}$. Caco- 2 and dog PK parameters were measured according to refs 7 a and $11 .{ }^{b}$ Compounds were dosed (po/iv) as TFA salts in a cassette dosing N -in-one format at $0.4 \mathrm{mg} / \mathrm{kg}$ iv and $0.2 \mathrm{mg} / \mathrm{kg} \mathrm{po}(n=$ 2). ${ }^{34 \mathrm{a}-\mathrm{c}} \mathrm{NT}$ indicates "not tested."
