S Supporting Information

ABSTRACT: Wide-ranging exploration of potential replacements for a quinoline-based inhibitor of activation of AKT kinase led to number of alternative, novel scaffolds with potentially improved potency and physicochemical properties. Examples showed predictable DMPK properties, and one such compound demonstrated pharmacodynamic knockdown of phosphorylation of AKT and downstream biomarkers in vivo and inhibition of tumor growth in a breast cancer xenograft model.

## INTRODUCTION

The PI3K-AKT signaling pathway is frequently activated in human cancers and plays a critical role in cell growth, proliferation, motility, and survival. ${ }^{1}$ This pathway is activated by several mechanisms in different cancer types, including somatic mutation, deletion, and amplification of genes encoding key components. Because of its prominent role in many cancer types, the PI3K-AKT pathway has become the focus of many cancer therapies, with a number of compounds currently in early clinical trials. ${ }^{2}$ Despite the significant efforts invested in the generation of inhibitors of components of this pathway, it remains unclear which cancers will benefit from such therapeutic approaches. The serine threonine kinase AKT (also known as protein kinase B or PKB) is a key effector of the PI3K-AKT signaling pathway and plays a pivotal role in cell survival and proliferation through modulation of a large number of downstream substrates. ${ }^{3}$ Following growth factor stimulation of PI3K, AKT is recruited to the plasma membrane. Colocalization with PDK1 at the plasma membrane allows the phosphorylation of threonine 308 (Thr308), located in the AKT activation loop. This phosphorylation event is necessary and sufficient for AKT activation. ${ }^{4}$ Further phosphorylation of AKT on serine 473 (Ser473), located in the C-terminal hydrophobic motif by the mTOR complex $2,{ }^{5}$ allows for maximal activation of the AKT enzyme.

There are three mammalian isoforms of AKT (AKT1, -2, and -3 ) that are broadly expressed in most normal tissues and are also expressed in most tumor types to varying degrees. The three enzymes have a similar organizational structure: an N terminal PH domain, a central serine/threonine catalytic domain, and a short regulatory region at the C-terminal, also called the hydrophobic motif. ${ }^{6}$ On the basis of the strong rationale for targeting AKT in cancer, many efforts have been
made to identify AKT inhibitors with acceptable pharmaceutical properties. However, because of the high sequence identity between the different AKT isoforms and other AGC kinases, the development of AKT-specific and isoform-specific inhibitors has been a real challenge for the pharmaceutical industry. The most common approaches described to date have been either through the design of compounds that are ATPcompetitive or prevent the formation of the active enzyme. ${ }^{7}$ Inhibitors targeting the PH domain have also been described. ${ }^{8}$ AKT inhibitors that are ATP competitive paradoxically cause the hyperphosphorylation of AKT at its two main regulatory sites (Thr308 and Ser473) as a consequence of a disrupted feedback mechanism caused by the direct binding of the inhibitor to the kinase. ${ }^{9}$ In contrast, allosteric inhibitors cause a decrease in the phosphorylation of AKT at these two sites. The clinical significance of these findings is still unclear, with a number of AKT inhibitors currently being tested in clinical trials. These include allosteric inhibitors of inactive AKT, such as MK-2206 (1), ${ }^{10}$ and ATP-competitive inhibitors of active enzyme, such as GDC0068 (2), ${ }^{11}$ GSK2141795, ${ }^{12}$ and AZD5363 (Figure 1). ${ }^{13}$ It will be important to establish whether the different modes of inhibition of AKT will deliver efficacy in late-stage clinical trials. In order to compliment our own work with AZD5363, we were interested in exploring additional opportunities around an allosteric inhibitor of inactive AKT profile such as that described for $\mathbf{1 .}$

## RESULTS AND DISCUSSION

Design of Inhibitors. At the outset of this work, since the binding mode of $\mathbf{1}$ had not yet been reported, it was unclear

which elements of the structure were critical for binding to AKT. Analysis of the extensive literature ${ }^{14}$ of this series did however give an indication of which groups had been successfully varied and those which had largely been held constant, which was suggestive of an absolute basic pharmacophore. Figure 2 illustrates assumptions about the general requirements for binding based on published literature, together with our proposed strategy for optimization based on exploration of scaffolds outside of the perceived basic pharmacophore. The central scaffolds in the published SAR (Figure 2, left panel), often groups such as pyridine or quinoline, always retain an $\mathrm{sp}^{2}$ nitrogen atom, which suggested a potential role in hydrogen bonding to AKT. Subsequent to this work, the first reported crystal structure of a compound related to $\mathbf{1}$ bound to AKT has been disclosed. ${ }^{15}$ While this structure confirms binding of inhibitor to the PH domain and C - and N -terminal lobes of the inactive kinase, no such hydrogen bond is observed, however. The scaffold itself can be extended in a number of ways, with examples of mono-, bi-, and tricyclic ring systems all reported. The lower pendant phenyl ring in all iterations remains unsubstituted, suggesting a relatively small lipophilic pocket in this region, and indeed, the related crystal structure shows this to be the case. A basic benzylic amine functionality appended to the upper phenyl ring is a common feature, although examples indicate that a wide variety of cyclic amines are tolerated, including those with relatively large overall size. The later reported structure indicated that this basic group is involved in a critical watermediated hydrogen bond to asparagine 54 (Asn54) on the PH domain. The proposed strategy to investigate alternative core structures that would, it was hoped, provide novel scaffolds able to potently inhibit AKT can be broken down into several
related themes. First, we wished to explore linear structures in which one ring junction contained a bridgehead nitrogen atom (Figure 2, right panel). Such a strategy has previously been successful in generating alternative scaffolds of quinazoline for inhibition of a variety of protein kinases, ${ }^{16}$ and indeed, independent of this work, a group at Bayer has recently reported success with this strategy against AKTT. ${ }^{17}$ In addition, we wished to explore opportunities for alternatively fused rings, here termed ring fusion "south" or "north", dependent on the direction of the scaffold. Such changes have not been described previously, and it should be noted that for ring fusion north such an approach necessarily removes what we (at the time) perceived to be a critical $\mathrm{sp}^{2}$ nitrogen atom. Nevertheless, it was felt that introduction of nitrogen into the resulting fivemembered ring might be able to compensate for this loss, if some flexibility in nitrogen lone pair orientation might be tolerated. Finally, we explored a small number of additional novel scaffolds that were shown to be both synthetically accessible and novel, with energy-minimized conformations of all ideas proposed overlaid with those of the working pharmacophore to ensure consistency.

Compound 1 represents a highly optimized candidate drug. In order to be able to benchmark the utility of any novel scaffolds synthesized, it was important to use a suitable reference compound of similar size rather than 1 itself. The primary goal was to understand which, if any, novel scaffold could offer a platform for AKT inhibition, with further optimization of any scaffold reserved for subsequent studies. In the event, we selected compound 3 (Table 1) to act as the reference since quinoline is the simplest of the literaturevalidated bicyclic scaffolds. Although compound 3 has not previously been reported, the quinoline core has been described with a variety of alternative, extended amines in place of the cyclobutylamine moiety present in $1 .{ }^{18}$ Reference compound 3 is able to potently inhibit phosphorylation of AKT in cells at both Thr308 and Ser473, consistent with its mechanism of action, with $\mathrm{IC}_{50}$ 's of 0.557 and $0.250 \mu \mathrm{M}$, respectively (Table 1). Enzyme activity was routinely assayed for all analogues synthesized. It should be noted, however, that the enzymatic assay utilized here was one using active enzyme, designed specifically for the purpose of testing inhibitors of catalysis, rather than, compounds that bind to and stabilize inactive enzyme. Nevertheless, such an assay is able to pick up activity via both modes of inhibition-the quoted activity is therefore an underestimate of the true level of potency-and generally cell activity was used to monitor chemistry progress. Compound 3 demonstrates a moderately high lipophilicity

$(\log D=3.6)$, and consequently low free drug ( $1.1 \%$ free drug measured in Han Wistar rat plasma) and a modest solubility of $290 \mu \mathrm{M}$.

Synthesis of AKT Inhibitors. Herein is discussed the synthesis of representative structures explored during the course of this work as detailed in Table 4. Complete experimental details of all compounds described can additionally be found in the Supporting Information. Reference quinoline 3 was synthesized from iodoquinoline starting material 27 via a sequence of Suzuki coupling to give phenylacetontrile 28, followed by installation of the cyclobutyl moiety through double alkylation with dibromopropane (Scheme 1). The requisite amine was obtained following

Curtius rearrangement of acid 30, and hydrolysis of the relatively stable resulting isocyanate 31, to give 3 . Starting with commercially available dichloropyridazine 32, amination gave intermediate 33, which was used in the synthesis of imidazopyridazine 5 . Reaction of 33 with chloroacetaldehyde gave bicycle 34, which yielded target 5 following Suzuki coupling and deprotection to install the requisite cyclobutylamine side chain.

Pyrazolopyridine 39 was synthesized via a [3+2] cycloaddition between 1 -aminopyridinium iodide and acetylenic ester 38 (Scheme 2), itself assembled in a short sequence from bromide 35 involving acetylenic coupling and double alkylation with ethyl chloroformate. Target scaffold $\mathbf{6}$ was subsequently

## Scheme 2. Synthesis of 6,5-Bridgehead-Based Scaffolds 6 and 7

Reagents and conditions: (i) TMS-acetylene, $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}, \mathrm{CuI}, \mathrm{Et}_{3} \mathrm{~N}$, tetrahydrofuran, $70^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (ii) $\mathrm{K}_{2} \mathrm{CO}_{3}$, methanol, rt, 1 h ; (iii) LDA, tetrahydrofuran, $\mathrm{ClCO}_{2} \mathrm{Et},-78^{\circ} \mathrm{C}$ to rt , 1.5 h ; (iv) 1-aminopyridinium iodide, $\mathrm{DBU}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C}$ to $\mathrm{rt}, 18 \mathrm{~h}$; (v) NaOH, ethanol, $100^{\circ} \mathrm{C}, 2 \mathrm{~h}$; (vi) NBS, $\mathrm{Na}_{2} \mathrm{CO}_{3}$, dimethylformamide, rt, 1 h ; (vii) phenylboronic acid, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{Pd}_{( }\left(\mathrm{Ph}_{3}\right)_{2} \mathrm{Cl}_{2}$, dimethylformamide, 1,2-dimethoxyethane, ethanol, $\mathrm{H}_{2} \mathrm{O}, 150^{\circ} \mathrm{C}, 15 \mathrm{~min}$; (viii) TFA, dichloromethane, rt, 2 h ; (ix) tert-butyl $N$-[1-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]cyclobutyl]carbamate, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$, dimethylformamide, 1,2-dimethoxyethane, ethanol, $\mathrm{H}_{2} \mathrm{O}, 150{ }^{\circ} \mathrm{C}, 10 \mathrm{~min}$; (x) NIS, CH phenylboronic acid, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}, \operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$, dimethylformamide, 1,2-dimethoxyethane, ethanol, $\mathrm{H}_{2} \mathrm{O}, 150{ }^{\circ} \mathrm{C}, 15 \mathrm{~min}$; (xii) TFA, dichloromethane, $\mathrm{rt}, 2 \mathrm{~h}$.

Scheme 3. Synthesis of Imidazopyrazine Scaffold 11

Reagents and conditions: (i) tert-butyl $N$-[1-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]cyclobutyl] carbamate, $\mathrm{Pd}^{( }\left(\mathrm{PPh}_{3}\right)_{4}$, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}$, $100{ }^{\circ} \mathrm{C}, 2 \mathrm{~h}$; (ii) phenylboronic acid, $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}$, dioxane, $110^{\circ} \mathrm{C}, 1 \mathrm{~h}$; (iii) 2-chloroacetaldehyde, $\mathrm{H}_{2} \mathrm{O}$, dimethylformamide, $70^{\circ} \mathrm{C}, 1.5$ h then HCl dioxane, dichloromethane, $\mathrm{rt}, 1 \mathrm{~h}$.
obtained in a sequence involving ester hydrolysis, decarboxylative bromination to give 41, followed by Suzuki coupling and deprotection. Its regioisomer 7 was obtained more simply from imidazopyridine 43 through a Suzuki-iodination-Suzuki coupling protocol to give 46 and then 7 via deprotection. 5-Bromo-6-chloropyrazin-2-amine served as starting material for synthesis of the imidazopyrazine core 11 (Scheme 3). Judicious selection of boronic acid coupling partners allowed selective differentiation of first the bromo and then chloro functionalities to yield aminopyrazine 48. Treatment with chloroacetaldehyde to form the imidazole ring and then deprotection afforded 11.

Fused south naphthyridine analogue 15 was obtained using a procedure described by Wu. ${ }^{19}$ Phenylacetylene 37 was coupled with an $o$-bromopyridine aldehyde to give 49 . The oxime product 50 formed by condensation with $O$-methylhydroxylamine was cyclized under copper catalysis conditions to give naphthyridine 51. From here, Suzuki coupling to install the pendant phenyl ring and deprotection afforded the target 15 (Scheme 4). Finally, pyridine scaffold 26 was synthesized by sequential selective Suzuki coupling on 5,6-dichloropyridine-3-
carbonitrile (Scheme 5). Deprotection under acidic conditions resulted in concomitant hydrolysis of the nitrile group to primary amide 26.

Structure-Activity and Structure-Property Relationships for Scaffolds with Bridgehead Nitrogen. Table 1 shows enzyme and cell activity data together with measured log $D$, rat plasma protein binding, and aqueous solubility for the reference compound 3 together with a variety of alternative scaffolds that all feature a single bridgehead nitrogen atom. To incorporate this feature necessitates a switch to a 5,6 -ring system ( 4,5 ), a 6,5 -ring system ( $6-8$ ), or, where the 6,6 -ring is maintained as in 9 , incorporation of an exocyclic carbonyl group to maintain valence. All of these analogues maintain an $\mathrm{sp}^{2}$ nitrogen at a position equivalent to that found in quinoline 3. Compound $\mathbf{4}$ shows a drop in potency across all assays relative to the quinoline, and solubility is lower despite a similar $\log D$. Interestingly, incorporation of an extra nitrogen in the five-membered ring, as in $\mathbf{5}$, results in an increase in potency to give a profile close to that of the quinoline, albeit with much improved free drug (over 10 -fold). Initially more speculative

## Scheme 4. Synthesis of Fused South Analogue 15

Reagents and conditions: (i) 4-bromopyridine-3-carbaldehyde, $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}, \mathrm{CuI}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{rt}, 42 \mathrm{~h}$; (ii) $\mathrm{MeONH}_{2} . \mathrm{HCl}, \mathrm{Et}_{3} \mathrm{~N}$, dichloromethane, $\mathrm{rt}, 5.5 \mathrm{~h}$; (iii) $\mathrm{CuCl}_{2}$, DMA, $100^{\circ} \mathrm{C}$, 3.5 h ; (iv) phenylboronic acid, $\mathrm{Pd}(\mathrm{OAc})_{2}$, potassium orthophosphate, toluene, $80^{\circ} \mathrm{C}, 2 \mathrm{~h}$; (v) HCl , dioxane, dichloromethane, $\mathrm{rt}, 15 \mathrm{~min}$.

Scheme 5. Synthesis of Pyridine Scaffold 26

Reagents and conditions: (i) tert-butyl $N$-[1-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl] cyclobutyl] carbamate, 1,1-bis(di-tertbutylphosphino)ferrocene palladium dichloride, aq $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{CH}_{3} \mathrm{CN}$, $80{ }^{\circ} \mathrm{C}, 18 \mathrm{~h}$; (ii) phenylboronic acid, $\mathrm{Pd}(\mathrm{OAc})_{2}$, potassium orthophosphate, toluene, $80{ }^{\circ} \mathrm{C}, 2 \mathrm{~h}$ then HCl , dioxane, dichloromethane, methanol, rt, 3.5 h .
analogues such as 6 and 7, in which the central six-memberedring scaffold common to all existing disclosures is swapped for a five-membered ring, also show potent inhibition. Pyrazolopyridine 6 and imidazopyridine 7 show an activity similar to that of quinoline 3, with the latter showing reduced lipophilicity and significantly improved free drug and solubility. An analogue of 7 with a primary carboxamide appended, $\mathbf{8}$ was synthesized since overlays with 1 indicated this vector overlays with the triazolone moiety. This modification resulted in improved potency with the $\mathrm{IC}_{50}$ reaching sub- 100 nM in cells, together with a significant drop in lipophilicity, although solubility remains modest. Pyridazinopyrimidinone 9 represents an interesting alternative core to quinoline 3 , showing a dramatically lowered $\log D$ and high solubility. In this case, however, potency in cells is substantially impacted; while it may be tempting to speculate a permeability issue due to $\operatorname{low} \log D$, the reduced activity in the enzyme assay suggests an inherent mismatch in binding at the target level.

Structure-Activity and Structure-Property Relationships for Scaffolds with a Fused South Ring Structure. We next examined the effect of fusing a second ring to the lower part of the scaffold, a modification not reported in the literature. Initially, a series of 5,6 -fused ring systems exemplified
by $\mathbf{1 0} \mathbf{- 1 2}$ were synthesized (Table 2). Compound $\mathbf{1 0}$ and its aza-homologue 11 showed similar, if slightly reduced, activity to reference 3 , with a significant reduction in $\log D$ contributing to very high solubility and free drug levels in the case of $\mathbf{1 1}$. Both of these analogues again exhibit a bridgehead nitrogen. Compound 12, without this feature shows reduced activity, possibly due to the bulky nitrogen substituent causing unfavorable twists in the adjacent pendant aromatic groups. Moving on to examine 6,6 -ring systems, compound 13 is the exact analogue of reference 3 , albeit now with an isoquinoline scaffold in place of quinoline. In this case, the potency and physicochemical property profile is indistinguishable from reference 3. The effect of successive aza-substitution was examined in the four naphthyridine isomers 14-17. Interestingly, each of these showed an improved potency over the corresponding isoquinoline/quinoline core. Aza substitution imparts over $1.5 \log$ units lowered lipophilicity in each case, and this manifests in much improved solubility and good free drug levels. 1,7- And 2,7-napthyridines (14 and 15, respectively) appear preferred over 2,6- and 1,6-napthyridines (16 and 17, respectively).

Structure-Activity and Structure-Property Relationships for Scaffolds with a Fused North Ring Structure. Literature exemplification of allosteric AKT inhibitors allude to the importance of the quinoline (or similar) ring nitrogen. Extending this work to look at ring fusion in the direction of this atom carried the risk then that activity may be significantly impacted. We speculated that incorporation of additional ring heteroatoms might be able to compensate for loss of the quinoline nitrogen. Gratifyingly, pyrazolopyridine 18 and imidazopyridine 19 both proved to be active, with the latter having a similar activity profile to quinoline 3 , with the additional benefit of a substantially lowered $\log D$, albeit with similar solubility levels (Table 3). Compound 20, which does not contain a ring nitrogen atom in the vicinity of its position in quinoline 3, shows reduced activity as anticipated. Triazolopyridine scaffold 21 represents a potent alternative to quinoline,

again with a dramatically $\operatorname{lowered} \log D$ and higher solubility. The alternative triazolopyridine isomer 22 shows slightly reduced potency. Whereas all of these scaffolds contain a bridgehead nitrogen, good potency is also achieved from a simple benzimidazole core $\mathbf{2 3}$. Here, a reduced $\log D$ relative to quinoline is combined with a potentially useful additional vector for further optimization in the pendant $N$-methyl substituent. Table 3 also contains additional scaffolds that were examined as part of this work. Quinazolone cores 24 and 25 are interesting, since they allow each of the pendant phenyl rings to be linked to the core via a nitrogen atom, as opposed to carbon in all previous examples. However, despite substantial $\log D$ and solubility improvements, both cores show severely compromised potency. As expected, the isomer 24 that retains a quinoline-like nitrogen demonstrates the most activity. The overall reduced potency, even in this case, may be due to unfavorable interaction between the lower carbonyl and pendant phenyl group, although QM calculations indicate minimal difference in the pendant phenyl torsion angle between 24 and quinoline 3. Pyridine amide derivative 26 was also synthesized. Pyridine, specifically with a pendant nitrile group, has previously been validated as a scaffold for AKT inhibition, ${ }^{20}$ although only previously combined with extended lipophilic amine side chains; in this case, even with a much truncated basic side chain, good potency is maintained and is combined with exceptional free drug levels.

Docking Studies. The recently disclosed ${ }^{15}$ crystal structure of an analogue of $\mathbf{1}$ was used as the basis for docking studies of the most potent inhibitor discovered here, compound 15 as shown in Figure 3. A model of 15 was built ${ }^{21}$ and then docked ${ }^{22}$ into the native crystal structure (PDB code 3O96) using standard precision and no constraints. Satisfyingly, the docked molecule overlaid well with the literature compound (omitted for clarity), and we assume the same bridging water interaction between primary amine, Water 455, and Asn54. $\operatorname{Trp} 80$ appears to make a significant $\pi-\pi$ stacking interaction with the aza isoquinoline scaffold of $\mathbf{1 5}$, and may in part explain the high potency seen with a seemingly diverse set of heterocyclic scaffolds. The pendant naked phenyl substituent seen in all inhibitors sits in a relatively small lipophilic pocket bounded by Leu210, Leu264, Tyr272, Ile290, and Asp292, and the cyclobutyl ring sits in an adjacent pocket bounded by Tyr272, Asp274, and Gly294. No further optimization was performed.

DMPK and in Vivo Activity of Selected Examples. A selection of analogues that showed a good combination of potency and acceptable lipophilicity/solubility was examined in in vitro and in vivo DMPK assays, specifically rat and human in vitro hepatocyte clearance assays and rat iv and po studies (Table 4). Reference 3 was first benchmarked. This compound showed high rat in vitro clearance, but despite this, moderate in vivo clearance was observed, albeit with no oral exposure.

Table 3. Ring-Fused Scaffolds (North), Quinazoline Scaffolds 24 and 25, and Pyridine Scaffold 26-Activity and Selected Physicochemical Data
Solubility

Figure 3. Compound 15 docked into AKT based on PDB code 3096. $\operatorname{Trp} 80 \pi-\pi$ stacks with the aza isoquinoline scaffold, and there is an assumed water-mediated hydrogen bond between the inhibitor primary amine and Asn54.

Human in vitro clearance for this reference was significantly lower than in rat. Bridgehead analogues 5 and $\mathbf{6}$ both exhibited moderate to high clearance and consequently no oral exposure. Interestingly compound 7, the positional isomer of 6, shows a bioavailability of $36 \%$, despite a moderately high in vivo clearance. Generally, the in vitro hepatocyte data predicted in vivo clearance within a reasonable spread in rat, where both data points existed. Figure 4 shows the predicted (from hepatocytes) versus measured in vivo clearance for the compounds in Table 4, according to the well-stirred model. ${ }^{23}$ In vivo clearance is predicted to within a 2 -fold range, a reasonable approximation. Compound 11 shows a similar bioavailability, here combined with low in vitro clearance in both rat and human hepatocytes. Compound 15, the most potent scaffold identified from this work, shows very high human in vitro clearance although modest rat in vivo clearance. Finally, pyridine analogue 26 shows the lowest clearance in both in vitro and in vivo assays and consequently good bioavailability of $48 \%$. The combination of this compound's good potency and very high free drug levels made it a candidate for further in vivo efficacy profiling.

Biological Activity. The biological activity and specific pharmacology of compound $\mathbf{2 6}$ was characterized by measuring the phosphorylation of its downstream substrate PRAS40 in the BT474c breast adenocarcinoma cell line. Compound 26 was

shown to potently inhibit the phosphorylation of PRAS40 (Figure 5). Consistent with a prevention of activation mechanism of action, compound 26 also inhibited the phoshorylation of AKT on Ser473 and Thr308. Furthermore, compound 26 inhibited the phosphorylation of ribosomal protein S6, a downstream effector of the PI3K-AKT pathway.

The effects of compound 26 in vivo were characterized by measuring the pharmacodynamic activity of this compound in a BT474c breast adenocarcinoma xenograft model. Following acute doses of 100 and $200 \mathrm{mg} / \mathrm{kg}$, compound 26 potently inhibited the phosphorylation of its downstream substrate GSK3 $\beta$ as well as the phosphorylation of AKT (Ser473), with a potency consistent with its pharmacokinetic profile (Figure 6). The in vivo activity of compound 26 was further characterized by measuring the effects on the growth of tumor cell xenografts. Continuous (daily) oral dosing of compound 26 (100 and 200 $\mathrm{mg} / \mathrm{kg}$ ) to nude mice bearing BT474c breast adenocarcinoma xenografts resulted in inhibition of tumor growth in a dosedependent manner. When dosed at $200 \mathrm{mg} / \mathrm{kg}$ daily, compound 26 caused significant tumor growth inhibition (Figure 7).

Conclusions. Inhibition of the AKT pathway represents a significant current focus for oncology drug discovery, and agents that target both active and inactive AKT are in clinical trials. Both profiles offer potential benefits and risks, and the true value of these individual strategies will emerge in due course. Known quinoline-based inhibitors of inactive AKT have demonstrated a unique cellular phenotype when compared with inhibitors of active kinase, and here we have demonstrated that a broad range of readily accessible alternative scaffold templates also have the potential to provide a platform for AKT inhibition, many with improved potency and physicochemical properties. Subsequent to this work, a range of other scaffolds has also been reported to effectively mimic quinolines in the

context of AKT inhibition, such as imidazopyridines, ${ }^{24}$ furopyridines, ${ }^{25}$ and chromenones, ${ }^{26}$ further broadening the pharmacophore for activity.

## EXPERIMENTAL METHODS

Chemistry. All reactions were performed under inert conditions (nitrogen) unless otherwise stated. All solvents and reagents were purchased from commercial sources and used without further purification. For coupling reactions, all solvents were dried and degassed prior to reaction. Reactions performed under microwave irradiation utilized either a Biotage initiator or CEM Discover microwave. Upon workup, organic solvents were typically dried prior to concentration with anhydrous $\mathrm{MgSO}_{4}$ or $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Flash silica chromatography was typically performed on an Isco Companion, using Silicycle silica gel ( $230-400$ mesh, $40-63 \mu \mathrm{~m}$ cartridges), Grace Resolv silica cartridges, or Isolute Flash Si or Si II cartridges. Reversephase chromatography was performed using a Waters XBridge Prep C18 OBD column ( $5 \mu \mathrm{~m}$ silica, 19 mm diameter, 100 mm length), using decreasingly polar mixtures of either water (containing $1 \% \mathrm{NH}_{3}$ ) and MeCN , or water (containing $0.1 \%$ formic acid) and MeCN as eluents. Analytical LC-MS was performed on a Waters 2790 LC with
a 996 PDA and 2000 amu ZQ single quadrupole mass spectrometer using a Phenomenex Gemini $50 \times 2.1 \mathrm{~mm}, 5 \mu \mathrm{~m}$, C18 column, or UPLC was performed on an Waters Acquity binary solvent manager with Acquity PDA and an SQD mass spectrometer using a $50 \times 2.1$ $\mathrm{mm}, 1.7 \mu \mathrm{~m}$ BEH column from Waters, and purities were measured by UV absorption at 254 nm or TIC and are $\geq 95 \%$ unless otherwise stated. NMR spectra were recorded on a Bruker Av400 or Bruker DRX 400 spectrometer at 400 MHz in DMSO- $d_{6}$ at 303 K unless otherwise indicated. ${ }^{1} \mathrm{H}$ NMR spectra are reported as chemical shifts in parts per million ( ppm ) relative to an internal solvent reference.

2-(4-(3-Phenylquinolin-2-yl)phenyl)acetonitrile (28). Pd$\left(\mathrm{PPh}_{3}\right)_{4}(0.21 \mathrm{~g}, 0.2 \mathrm{mmol})$ was added to 2-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)acetonitrile ( $0.94 \mathrm{~g}, 3.9 \mathrm{mmol}$ ), 27 $(1.22 \mathrm{~g}, 3.7 \mathrm{mmol})$, and aq $\mathrm{K}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 5.53 \mathrm{~mL}, 11.1 \mathrm{mmol})$ in dioxane ( 31 mL ) and the mixture stirred at $100^{\circ} \mathrm{C}$ for 18 h . The reaction mixture was partitioned between ethyl acetate and water; the organic layer was washed with water and then saturated brine, dried, and concentrated; and the crude product was purified by silica chromatography ( $5-30 \%$ ethyl acetate in isohexane) to afford 28 ( 1.1 $\mathrm{g}, 93 \%$ ) as a yellow foam: ${ }^{1} \mathrm{H}$ NMR $\delta 4.05(2 \mathrm{H}, \mathrm{s}), 7.25-7.39(7 \mathrm{H}$, $\mathrm{m}), 7.39-7.47(2 \mathrm{H}, \mathrm{m}), 7.61-7.71(1 \mathrm{H}, \mathrm{m}), 7.82(1 \mathrm{H}, \mathrm{ddd}), 8.09$ $(2 \mathrm{H}, \mathrm{dd}), 8.41(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=321$.

1-(4-(3-Phenylquinolin-2-yl)phenyl)cyclobutanecarbonitrile (29). Tetra- $n$-butylammonium bromide ( $0.025 \mathrm{~g}, 0.1 \mathrm{mmol}$ ), $1,3-$ dibromopropane ( $0.17 \mathrm{~mL}, 1.7 \mathrm{mmol}$ ), and $28(0.5 \mathrm{~g}, 1.6 \mathrm{mmol})$ were added to $\mathrm{KOH}(0.44 \mathrm{~g}, 7.8 \mathrm{mmol})$ in toluene $(3 \mathrm{~mL})$ and water $(0.23$ mL ) at $70^{\circ} \mathrm{C}$. The resulting mixture was heated at $100^{\circ} \mathrm{C}$ for 70 min , cooled to room temperature, and diluted with toluene. The mixture was washed with water and concentrated and the crude product purified by silica chromatography ( $5-20 \%$ ethyl acetate in isohexane) to afford $29(0.24 \mathrm{~g}, 42 \%)$ as a pale yellow solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.93-2.09$ $(1 \mathrm{H}, \mathrm{m}), 2.19-2.37(1 \mathrm{H}, \mathrm{m}), 2.54-2.80(4 \mathrm{H}, \mathrm{m}), 7.25-7.45(7 \mathrm{H}, \mathrm{m})$, $7.48(2 \mathrm{H}, \mathrm{d}), 7.67(1 \mathrm{H}, \mathrm{t}), 7.77-7.88(1 \mathrm{H}, \mathrm{m}), 8.09(2 \mathrm{H}, \mathrm{d}), 8.42$ $(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}+),(\mathrm{M}+\mathrm{H})^{+}=361$.

1-(4-(3-Phenylquinolin-2-yl)phenyl)cyclobutanecarboxylic Acid (30). KOH ( $111 \mathrm{mg}, 2 \mathrm{mmol}$ ) was added to $29(238 \mathrm{mg}, 0.7$ $\mathrm{mmol})$ in $2,2^{\prime}$-oxidiethanol $(1.9 \mathrm{~mL})$ and the resulting mixture stirred at $245^{\circ} \mathrm{C}$ for 75 min in a microwave reactor. The reaction mixture was allowed to cool to room temperature, diluted with water, and adjusted to pH 4.6 with aq $\mathrm{HCl}(2 \mathrm{M})$. The precipitate was collected by filtration, washed with water, and dried and the crude product purified by silica chromatography ( $0-100 \%$ ethyl acetate in dichloromethane) to afford $30(135 \mathrm{mg}, 54 \%)$ as a beige solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.80(1 \mathrm{H}, \mathrm{dq})$,
1.86-2.02 (1H, m), $2.37(2 \mathrm{H}, \mathrm{ddd}), 2.63-2.76(2 \mathrm{H}, \mathrm{m}), 7.21(2 \mathrm{H}, \mathrm{d})$, $7.26-7.43(7 \mathrm{H}, \mathrm{m}), 7.65(1 \mathrm{H}, \mathrm{dd}), 7.76-7.86(1 \mathrm{H}, \mathrm{m}), 8.07(2 \mathrm{H}, \mathrm{d})$, $8.39(1 \mathrm{H}, \mathrm{s}), 12.32(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}+),(\mathrm{M}+\mathrm{H})^{+}=380$.

2-(4-(1-Isocyanatocyclobutyl)phenyl)-3-phenylquinoline (31). DPPA ( $92 \mu \mathrm{~L}, 0.4 \mathrm{mmol}$ ) was added to $30(108 \mathrm{mg}, 0.3 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(59 \mu \mathrm{~L}, 0.4 \mathrm{mmol})$ in dichloromethane $(1 \mathrm{~mL})$ and the mixture stirred at $25^{\circ} \mathrm{C}$ for 4 h . The reaction mixture was diluted with dichloromethane and water, and the organic layer was washed with brine, dried, and concentrated to afford $31(107 \mathrm{mg})$ which was used without further purification: $m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=377$.

1-(4-(3-Phenylquinolin-2-yl)phenyl)cyclobutanamine (3). Compound 31 ( $107 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) in aq $\mathrm{HCl}(2 \mathrm{M}, 2.5 \mathrm{~mL}, 5$ mmol ) was stirred at $60^{\circ} \mathrm{C}$ for 5.5 h . The reaction mixture was cooled to room temperature, diluted with methanol, and purified by ion exchange chromatography, using a 5 g SCX-3 column ( $7 \mathrm{M} \mathrm{NH}_{3}$ / methanol) to afford crude product which was further purified by silica chromatography (50-100\% ethyl acetate in isohexane) to afford 3 (59 $\mathrm{mg}, 60 \%)$ as a white foamy solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.57-1.71(1 \mathrm{H}, \mathrm{m})$, $1.93-2.12(5 \mathrm{H}, \mathrm{m}), 2.30-2.42(2 \mathrm{H}, \mathrm{m}), 7.27-7.41(9 \mathrm{H}, \mathrm{m}), 7.60-$ $7.68(1 \mathrm{H}, \mathrm{m}), 7.80(1 \mathrm{H}$, ddd), $8.07(2 \mathrm{H}, \mathrm{dd}), 8.38(1 \mathrm{H}, \mathrm{s})$; HRMS m/ $z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=351.18536$ (theoretical 351.185 58).

6-Chloro-5-phenylpyridazin-3-amine (33). $\mathrm{NH}_{3}$ in methanol ( $7 \mathrm{M}, 2.29 \mathrm{~mL}, 16 \mathrm{mmol}$ ) and $32(1 \mathrm{~g}, 4.4 \mathrm{mmol})$ were dissolved in ethanol ( 14.1 mL ) and heated at $150{ }^{\circ} \mathrm{C}$ for 24 h in a microwave reactor and then cooled to room temperature. The reaction mixture was evaporated, dissolved in dichloromethane $(100 \mathrm{~mL})$, and washed sequentially with saturated aq $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$ and brine $(50 \mathrm{~mL})$. The organic layer was dried and evaporated to afford crude product which was purified by silica chromatography ( $0-5 \%$ methanol in dichloromethane) to afford $33(0.45 \mathrm{~g}, 49 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 6.66(2 \mathrm{H}, \mathrm{s}), 6.80(1 \mathrm{H}, \mathrm{s}), 7.45-7.56(5 \mathrm{H}, \mathrm{m}) ; m / z(\mathrm{ES}+)(\mathrm{M}$ $+\mathrm{H})^{+}=206$.

6-Chloro-7-phenylimidazo[1,2-b]pyridazine (34). Compound $33(360 \mathrm{mg}, 1.8 \mathrm{mmol})$ in ethanol $(4 \mathrm{~mL})$ was stirred at $60^{\circ} \mathrm{C}$. Aqueous 2-chloroacetaldehyde ( $55 \%, 2.0 \mathrm{~mL}, 7 \mathrm{mmol}$ ) was added dropwise, and the reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 16 h , cooled to room temperature, diluted with ethyl acetate ( 30 mL ), washed with saturated aq $\mathrm{NaHCO}_{3}(2 \times 20 \mathrm{~mL})$, dried, and evaporated to give a solid. The solid was triturated with isohexane and collected by filtration to afford $34(325 \mathrm{mg}, 81 \%)$ as a pale yellow solid: ${ }^{1} \mathrm{H}$ NMR $\delta 7.45-7.59(5 \mathrm{H}, \mathrm{m}), 7.89(1 \mathrm{H}, \mathrm{d}), 8.21(1 \mathrm{H}, \mathrm{d})$, $8.37-8.40(1 \mathrm{H}, \mathrm{m}) ; m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=230$.

1-(4-(7-Phenylimidazo[1,2-b]pyridazin-6-yl)phenyl)cyclobutanamine (5). tert-Butyl 1-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)cyclobutylcarbamate ( $163 \mathrm{mg}, 0.4 \mathrm{mmol}$ ), $34(100 \mathrm{mg}, 0.4 \mathrm{mmol})$, diacetoxyzinc $(88 \mathrm{mg}, 0.5 \mathrm{mmol})$, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}$ $(2 \mathrm{M}, 653 \mu \mathrm{~L}, 1.3 \mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(25 \mathrm{mg}, 0.02 \mathrm{mmol})$ were suspended in dioxane and heated at $100^{\circ} \mathrm{C}$ for 2 h in a microwave reactor and then cooled to room temperature, and the organic phase was decanted from the solidified $\mathrm{Na}_{2} \mathrm{CO}_{3}$ layer. The reaction mixture was evaporated to dryness to afford crude product which was purified by silica chromatography ( $0-5 \%$ methanol in dichloromethane) to afford a yellow oil. TFA $(454 \mu \mathrm{~L})$ was added to a solution of this in dichloromethane $(454 \mu \mathrm{~L})$ and the solution was stirred at room temperature for 1 h . The reaction mixture was evaporated and dissolved in methanol. The crude product was purified by ion exchange chromatography, using an SCX column (7 M NH3/ methanol) to afford crude product. The product was further purified by silica chromatography ( $0-10 \%$ methanol in dichloromethane) to afford $5(37 \mathrm{mg}, 48 \%)$ as a white crystalline solid: ${ }^{1} \mathrm{H}$ NMR (MeOD) $\delta 1.69-1.84(1 \mathrm{H}, \mathrm{m}), 2.02-2.15(1 \mathrm{H}, \mathrm{m}), 2.21-2.33(2 \mathrm{H}, \mathrm{m}), 2.50-$ $2.60(2 \mathrm{H}, \mathrm{m}), 7.20-7.33(5 \mathrm{H}, \mathrm{m}), 7.33-7.43(4 \mathrm{H}, \mathrm{m}), 7.80(1 \mathrm{H}, \mathrm{d})$, $7.95(1 \mathrm{H}, \mathrm{d}), 8.15-8.19(1 \mathrm{H}, \mathrm{m}), 1 \times \mathrm{NH}_{2}$ not observed; $m / z(\mathrm{ES}+)$ $(\mathrm{M}+\mathrm{H})^{+}=341$.
tert-Butyl $N$-[1-[4-(2-Trimethylsilylethynyl)phenyl]cyclobutyl]carbamate (36). tert-Butyl 1-(4-bromophenyl)cyclobutylcarbamate $35(4 \mathrm{~g}, 12.3 \mathrm{mmol})$ and ethynyltrimethylsilane ( $4.25 \mathrm{~mL}, 30.7 \mathrm{mmol}$ ) were stirred in tetrahydrofuran ( 150 mL ). $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(0.43 \mathrm{~g}, 0.6 \mathrm{mmol})$, $\mathrm{CuI}(47 \mathrm{mg}, 0.25 \mathrm{mmol})$, and triphenylphosphine $(0.32 \mathrm{~g}, 1.2 \mathrm{mmol})$ were added, followed by
triethylamine $(5.13 \mathrm{~mL}, 36.8 \mathrm{mmol})$. The solution was heated at $70^{\circ} \mathrm{C}$ for 18 h . Further portions of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(0.22 \mathrm{~g}, 0.3 \mathrm{mmol})$ and $\mathrm{CuI}(23 \mathrm{mg}, 0.12 \mathrm{mmol})$ were added followed by ethynyltrimethylsilane ( $2.12 \mathrm{~mL}, 15.3 \mathrm{mmol}$ ), and stirring was continued under nitrogen at $70{ }^{\circ} \mathrm{C}$ for 5 h , and then the mixture was allowed to cool to room temperature. The reaction mixture was filtered, concentrated, and then purified by silica chromatography ( $0-6 \%$ ethyl acetate in isohexane) to afford $36(930 \mathrm{mg}, 22 \%)$ as a yellow solid: ${ }^{1} \mathrm{H}$ NMR $\delta 0.00(9 \mathrm{H}, \mathrm{s})$, 0.95 and $1.09(9 \mathrm{H}, 2 \times \mathrm{bs}), 1.45-1.61(1 \mathrm{H}, \mathrm{m}), 1.67-1.82(1 \mathrm{H}, \mathrm{m})$, 2.06-2.20 (4H, m), $7.15(4 \mathrm{H}, \mathrm{dd}), 7.38(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}-)(\mathrm{M}-$ $\mathrm{H})^{-}=342$.
tert-Butyl 1-(4-Ethynylphenyl)cyclobutylcarbamate (37). Compound 36 ( $930 \mathrm{mg}, 2.7 \mathrm{mmol}$ ) was dissolved in methanol (45 $\mathrm{mL})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(4.62 \mathrm{~g}, 33.4 \mathrm{mmol})$ was added. The slurry was stirred at room temperature for 2.5 h and then concentrated. Water $(40 \mathrm{~mL})$ was added and the mixture was extracted with ethyl acetate $(3 \times 25 \mathrm{~mL})$. The combined extracts were washed with brine, dried, and evaporated to afford $37(0.73 \mathrm{~g}, 22 \%)$ as a brown gum which was used without further purification: ${ }^{1} \mathrm{H}$ NMR $\delta 0.90$ and $1.10(9 \mathrm{H}, 2 \times$ bs), 1.47-1.63 (1H, m), 1.68-1.84 (1H, m), 2.06-2.23 (4H, m), 3.87 $(1 \mathrm{H}, \mathrm{s}), 7.08-7.31(4 \mathrm{H}, \mathrm{m}), 7.39(1 \mathrm{H}, \mathrm{bs}) ; m / z(\mathrm{ES}-)(\mathrm{M}-\mathrm{H})^{-}=$ 270.

Ethyl 3-(4-(1-(tert-Butoxycarbonyl(ethoxycarbonyl)amino)cyclobutyl)phenyl)propiolate (38). LDA in tetrahydrofuran (1.8 $\mathrm{M}, 0.74 \mathrm{~mL}, 1.3 \mathrm{mmol})$ was added to $37(100 \mathrm{mg}, 0.4 \mathrm{mmol})$ in tetrahydrofuran $(5 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$. The resulting solution was stirred at $-78{ }^{\circ} \mathrm{C}$ for 20 min , ethyl chloroformate $(0.12 \mathrm{~mL}, 1.3 \mathrm{mmol})$ was added, and the mixture was allowed to warm to room temperature and stirred for 1 h . The reaction was diluted with ethyl acetate $(10 \mathrm{~mL})$ and washed with water $(2 \times 10 \mathrm{~mL})$ and brine $(10 \mathrm{~mL})$. The organic layer was dried and evaporated to afford crude product which was purified by silica chromatography ( $0-20 \%$ ethyl acetate in isohexane) to afford $38(99 \mathrm{mg}, 65 \%)$ as a colorless oil: ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 1.25$ $(3 \mathrm{H}, \mathrm{t}), 1.36(3 \mathrm{H}, \mathrm{t}), 1.41(9 \mathrm{H}, \mathrm{s}), 1.72-1.90(2 \mathrm{H}, \mathrm{m}), 2.52-2.71$ $(4 \mathrm{H}, \mathrm{m}), 4.18(2 \mathrm{H}, \mathrm{q}), 4.25-4.33(2 \mathrm{H}, \mathrm{m}), 7.53-7.59(2 \mathrm{H}, \mathrm{m}), 7.64-$ $7.68(2 \mathrm{H}, \mathrm{m})$. No molecular ion was observable.

Ethyl 2-(4-(1-(tert-Butoxycarbonyl(ethoxycarbonyl)amino)-cyclobutyl)phenyl)pyrazolo[1,5-a]pyridine-3-carboxylate (39). A solution of DBU $(286 \mathrm{mg}, 1.9 \mathrm{mmol})$ in acetonitrile $(5 \mathrm{~mL})$ was added dropwise to $38(390 \mathrm{mg}, 0.9 \mathrm{mmol})$ and 1 -aminopyridinium iodide ( $208 \mathrm{mg}, 0.9 \mathrm{mmol}$ ) in acetonitrile $(20 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min and then at room temperature for 18 h . The reaction mixture was diluted with ethyl acetate $(10 \mathrm{~mL})$ and washed with water $(2 \times 10 \mathrm{~mL})$ and brine $(10$ $\mathrm{mL})$. The organic layer was dried and evaporated to afford crude product which was purified by silica chromatography ( $0-20 \%$ ethyl acetate in isohexane) to afford $39(407 \mathrm{mg}, 85 \%)$ as a colorless oil: ${ }^{1} \mathrm{H}$ NMR $\delta 1.16(6 \mathrm{H}, \mathrm{dt}), 1.33(9 \mathrm{H}, \mathrm{s}), 1.64-1.73(1 \mathrm{H}, \mathrm{m}), 1.73-1.83$ $(1 \mathrm{H}, \mathrm{m}), 2.46-2.63(4 \mathrm{H}, \mathrm{m}), 4.06(2 \mathrm{H}, \mathrm{q}), 4.18(2 \mathrm{H}, \mathrm{q}), 7.12(1 \mathrm{H}$, td), $7.52-7.59(1 \mathrm{H}, \mathrm{m}), 7.62(2 \mathrm{H}, \mathrm{d}), 7.70(2 \mathrm{H}, \mathrm{d}), 8.09(1 \mathrm{H}, \mathrm{d}), 8.81$ $(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=508$.

2-(4-(1-(tert-Butoxycarbonylamino)cyclobutyl)phenyl)-pyrazolo[1,5-a]pyridine-3-carboxylic Acid (40). Aqueous NaOH $(2 \mathrm{M}, 3.8 \mathrm{~mL}, 1 \mathrm{mmol})$ was added to $39(45 \mathrm{mg}, 0.1 \mathrm{mmol})$ in ethanol $(2 \mathrm{~mL})$. The resulting solution was stirred at $100^{\circ} \mathrm{C}$ for 2 h and then cooled to room temperature. The reaction was concentrated and acidified with aq $\mathrm{HCl}(2 \mathrm{M})$ and then filtered to afford $40(310 \mathrm{mg}$, $97 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.36(9 \mathrm{H}, \mathrm{s}), 1.84(1 \mathrm{H}, \mathrm{s}), 1.95-$ $2.10(1 \mathrm{H}, \mathrm{m}), 2.43(4 \mathrm{H}, \mathrm{t}), 7.15(1 \mathrm{H}, \mathrm{t}), 7.45(2 \mathrm{H}, \mathrm{d}), 7.52-7.63(2 \mathrm{H}$, m), $7.75(2 \mathrm{H}, \mathrm{d}), 8.16(1 \mathrm{H}, \mathrm{d}), 8.83(1 \mathrm{H}, \mathrm{d}), 12.26(1 \mathrm{H}, \mathrm{s}) ; \mathrm{m} / z$ (ES-) $(\mathrm{M}-\mathrm{H})^{-}=406$.
tert-Butyl 1-(4-(3-Bromopyrazolo[1,5-a]pyridin-2-yl)phenyl)cyclobutylcarbamate (41). Compound 40 ( $290 \mathrm{mg}, 0.7 \mathrm{mmol}$ ), $\mathrm{Na}_{2} \mathrm{CO}_{3}(179 \mathrm{mg}, 2.1 \mathrm{mmol})$, and NBS ( $127 \mathrm{mg}, 0.7 \mathrm{mmol}$ ) in dimethylformamide $(2 \mathrm{~mL})$ were stirred at room temperature for 1 h . The mixture was poured into water $(150 \mathrm{~mL})$ and the resulting solid collected by filtration and washed with water to afford $41(288 \mathrm{mg}$, $91 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.35(9 \mathrm{H}, \mathrm{s}), 1.78-1.88(1 \mathrm{H}, \mathrm{m})$, $1.98-2.08(1 \mathrm{H}, \mathrm{m}), 2.44(4 \mathrm{H}, \mathrm{t}), 7.03(1 \mathrm{H}, \mathrm{t}), 7.37-7.44(1 \mathrm{H}, \mathrm{m})$,
$7.54(2 \mathrm{H}, \mathrm{d}), 7.62(2 \mathrm{H}, \mathrm{d}), 7.95(2 \mathrm{H}, \mathrm{d}), 8.77(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}$ $+\mathrm{H})^{+}=444$.
tert-Butyl 1-(4-(3-Phenylpyrazolo[1,5-a]pyridin-2-yl)phenyl)cyclobutylcarbamate (42). Phenylboronic acid ( $127 \mathrm{mg}, 1 \mathrm{mmol}$ ), aq $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 0.52 \mathrm{~mL}, 1 \mathrm{mmol}), 41(230 \mathrm{mg}, 0.5 \mathrm{mmol})$ and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(37 \mathrm{mg}, 0.05 \mathrm{mmol})$ were suspended in $18 \%$ dimethylformamide in 1,2-dimethoxyethane/water/ethanol (7:3:2) $(2 \mathrm{~mL})$, heated at $150{ }^{\circ} \mathrm{C}$ for 15 min in a microwave reactor, and then cooled to room temperature. The reaction mixture was diluted with ethyl acetate $(20 \mathrm{~mL})$ and washed with water $(2 \times 20 \mathrm{~mL})$ and brine $(20 \mathrm{~mL})$. The organic layer was dried and concentrated and the residue purified by flash silica chromatography ( $55-80 \%$ acetonitrile in water $\left.+1 \% \mathrm{NH}_{4} \mathrm{OH}\right)$ to afford $42(138 \mathrm{mg}, 60 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.06-1.41(9 \mathrm{H}, \mathrm{m}), 1.79(1 \mathrm{H}, \mathrm{s}), 1.99(1 \mathrm{H}, \mathrm{s}), 2.31-2.44$ $(4 \mathrm{H}, \mathrm{m}), 6.97(1 \mathrm{H}, \mathrm{td}), 7.23-7.32(1 \mathrm{H}, \mathrm{m}), 7.35(5 \mathrm{H}, \mathrm{d}), 7.42(2 \mathrm{H}$, d), $7.47(2 \mathrm{H}, \mathrm{d}), 7.53-7.64(2 \mathrm{H}, \mathrm{m}), 8.76(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}+$ $\mathrm{H})^{+}=440$.

1-(4-(3-Phenylpyrazolo[1,5-a]pyridin-2-yl)phenyl)cyclobutanamine (6). A solution of TFA in dichloromethane ( $10 \%$, $10 \mathrm{~mL})$ was added to $42(134 \mathrm{mg}, 0.3 \mathrm{mmol})$, and the mixture was stirred at room temperature for 2 h and then concentrated. The crude product was purified by ion exchange chromatography, using an SCX column ( $7 \mathrm{M} \mathrm{NH}_{3} /$ methanol ) to afford $\mathbf{6}(103 \mathrm{mg}, 100 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.60-1.72(1 \mathrm{H}, \mathrm{m}), 1.97-2.05(1 \mathrm{H}, \mathrm{m}), 2.06-2.15$ $(2 \mathrm{H}, \mathrm{m}), 2.39(2 \mathrm{H}, \mathrm{ddd}), 2.72(2 \mathrm{H}, \mathrm{bs}), 6.97(1 \mathrm{H}, \mathrm{td}), 7.27(1 \mathrm{H}$, ddd), $7.36(3 \mathrm{H}, \mathrm{dt}), 7.41-7.48(4 \mathrm{H}, \mathrm{m}), 7.53(3 \mathrm{H}, \mathrm{dd}), 8.76(1 \mathrm{H}, \mathrm{d})$; HRMS $m / z(E S+) \mathrm{M}^{+}=340.18057$ (theoretical 340.180 82).
tert-Butyl 1-(4-(Imidazo[1,2-a]pyridin-2-yl)phenyl)cyclobutylcarbamate (44). tert-Butyl 1-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)cyclobutylcarbamate ( $284 \mathrm{mg}, 0.8$ $\mathrm{mmol})$, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 0.31 \mathrm{~mL}, 0.6 \mathrm{mmol}), 43(100 \mathrm{mg}, 0.5$ $\mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(36 \mathrm{mg}, 0.05 \mathrm{mmol})$ were suspended in $18 \%$ dimethylformamide in 1,2-dimethoxyethane/water/ethanol (7:3:2) ( 2.0 mL ), and the mixture was heated at $150{ }^{\circ} \mathrm{C}$ for 10 min in a microwave reactor and then cooled to room temperature. The reaction mixture was diluted with ethyl acetate $(20 \mathrm{~mL})$ and washed with water $(2 \times 20 \mathrm{~mL})$ and brine $(20 \mathrm{~mL})$. The organic layer was dried and evaporated to afford crude product which was purified by flash silica chromatography, with an elution gradient from 0 to $50 \%$ ethyl acetate in isohexane, to afford $44(140 \mathrm{mg}, 76 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.32(9 \mathrm{H}, \mathrm{d}), 1.82(1 \mathrm{H}, \mathrm{s}), 1.97-2.07(1 \mathrm{H}, \mathrm{m}), 2.42(4 \mathrm{H}$, t), $6.89(1 \mathrm{H}, \mathrm{td}), 7.18-7.29(1 \mathrm{H}, \mathrm{m}), 7.44(2 \mathrm{H}, \mathrm{d}), 7.57(2 \mathrm{H}, \mathrm{d}), 7.91$ $(2 \mathrm{H}, \mathrm{d}), 8.36(1 \mathrm{H}, \mathrm{s}), 8.52(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=364$.
tert-Butyl 1-(4-(3-lodoimidazo[1,2-a]pyridin-2-yl)phenyl)cyclobutylcarbamate (45). NIS ( $222 \mathrm{mg}, 1 \mathrm{mmol}$ ) was added to $44(342 \mathrm{mg}, 0.9 \mathrm{mmol})$ in acetonitrile $(10 \mathrm{~mL})$. The resulting solution was stirred at room temperature for 1 h and then evaporated, and the residue was dissolved in ethyl acetate ( 25 mL ) and washed with aq $\mathrm{NaOH}(10 \% \mathrm{w} / \mathrm{v}, 25 \mathrm{~mL})$, water $(25 \mathrm{~mL})$, and brine $(25 \mathrm{~mL})$. The organic layer was dried and evaporated to afford $45(460 \mathrm{mg}, 100 \%)$ as a yellow oil: ${ }^{1} \mathrm{H}$ NMR $\delta 1.29(9 \mathrm{H}, \mathrm{d}), 1.82(1 \mathrm{H}, \mathrm{s}), 1.95-2.06(1 \mathrm{H}$, $\mathrm{m}), 2.43(4 \mathrm{H}, \mathrm{t}), 7.08(1 \mathrm{H}, \mathrm{td}), 7.31-7.41(1 \mathrm{H}, \mathrm{m}), 7.50(2 \mathrm{H}, \mathrm{d})$, $7.58-7.66(2 \mathrm{H}, \mathrm{m}), 8.02(2 \mathrm{H}, \mathrm{d}), 8.42(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+) \mathrm{M}+=490$.
tert-Butyl 1-(4-(3-Phenylimidazo[1,2-a]pyridin-2-yl)phenyl)cyclobutylcarbamate (46). Phenylboronic acid $(168 \mathrm{mg}, 1.4$ $\mathrm{mmol})$, aq $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 0.7 \mathrm{~mL}, 1.4 \mathrm{mmol}), 45(450 \mathrm{mg}, 0.9$ $\mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(65 \mathrm{mg}, 0.1 \mathrm{mmol})$ were suspended in $18 \%$ dimethylformamide in 1,2-dimethoxyethane/water/ethanol (7:3:2) (6 mL ), heated at $150{ }^{\circ} \mathrm{C}$ for 15 min in a microwave reactor, and then cooled to room temperature. The reaction mixture was diluted with ethyl acetate $(20 \mathrm{~mL})$ and washed with water $(2 \times 20 \mathrm{~mL})$ and brine $(20 \mathrm{~mL})$. The organic layer was dried and concentrated and the crude product purified by silica chromatography $(0-70 \%$ ethyl acetate in isohexane) to afford $46(259 \mathrm{mg}, 64 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta$ $1.31(9 \mathrm{H}, \mathrm{s}), 1.66-1.84(1 \mathrm{H}, \mathrm{m}), 1.90-2.03(1 \mathrm{H}, \mathrm{m}), 2.25-2.45(4 \mathrm{H}$, m), $6.88(1 \mathrm{H}, \mathrm{t}), 7.23-7.37(3 \mathrm{H}, \mathrm{m}), 7.42-7.70(9 \mathrm{H}, \mathrm{m}), 7.99(1 \mathrm{H}$, d) $; m / z(E S+)(M+H)^{+}=440$.

1-(4-(3-Phenylimidazo[1,2-a]pyridin-2-yl)phenyl)cyclobutanamine (7). TFA in dichloromethane ( $10 \%, 5 \mathrm{~mL}$ ) was added to $46(85 \mathrm{mg}, 0.2 \mathrm{mmol})$ and the solution was stirred at room
temperature for 2 h and then concentrated. The crude product was purified by ion exchange chromatography, using an SCX column (7 M $\mathrm{NH}_{3} /$ methanol $)$ to afford $7(64 \mathrm{mg}, 98 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta$ $1.58-1.72(1 \mathrm{H}, \mathrm{m}), 1.93-2.05(1 \mathrm{H}, \mathrm{m}), 2.06-2.19(2 \mathrm{H}, \mathrm{m}), 2.34-$ $2.45(2 \mathrm{H}, \mathrm{m}), 3.6(2 \mathrm{H}, \mathrm{s}), 6.89(1 \mathrm{H}, \mathrm{td}), 7.26-7.35(1 \mathrm{H}, \mathrm{m}), 7.38(2 \mathrm{H}$, d), $7.47-7.70(8 \mathrm{H}, \mathrm{m}), 7.99(1 \mathrm{H}, \mathrm{d})$; HRMS $m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=$ 340.18069 (theoretical 340.18082 ).

1-(4-(5-Amino-3-chloropyrazin-2-yl)phenyl)cyclobutylcarbamate (47). A tube was charged with 5-bromo-6-chloropyrazin-2-amine $(100 \mathrm{mg}, 0.5 \mathrm{mmol})$, tert-butyl 1 -(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)cyclobutylcarbamate (179 $\mathrm{mg}, 0.5 \mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(42 \mathrm{mg}, 0.04 \mathrm{mmol})$ in dioxane $(2$ $\mathrm{mL})$ and aq $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 0.48 \mathrm{~mL}, 1 \mathrm{mmol})$ and the reaction heated at $100{ }^{\circ} \mathrm{C}$ under microwave irradiation for 2 h . The reaction was filtered and evaporated and the crude product purified by silica chromatography ( $0-6 \%$ methanol in dichloromethane) to afford 47 $(162 \mathrm{mg}, 90 \%)$ as a yellow solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.17$ and $1.35(9 \mathrm{H}, 2 \times$ bs), $1.82(1 \mathrm{H}, \mathrm{s}), 2.00(1 \mathrm{H}, \mathrm{s}), 2.41(4 \mathrm{H}, \mathrm{s}), 6.94(2 \mathrm{H}, \mathrm{s}), 7.43(2 \mathrm{H}$, d), $7.59(2 \mathrm{H}, \mathrm{d}), 7.93(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}-)(\mathrm{M}-\mathrm{H})^{-}=373$.
tert-Butyl 1-(4-(5-Amino-3-phenylpyrazin-2-yl)phenyl)cyclobutylcarbamate (48). A tube was charged with $47(160 \mathrm{mg}$, $0.4 \mathrm{mmol})$, phenylboronic acid $(57 \mathrm{mg}, 0.5 \mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(49$ $\mathrm{mg}, 0.04 \mathrm{mmol})$ in dioxane $(2 \mathrm{~mL})$ and aq $\mathrm{Na}_{2} \mathrm{CO}_{3},(2 \mathrm{M}, 0.43 \mathrm{~mL}$, 0.9 mmol ) and then heated at $110^{\circ} \mathrm{C}$ under microwave irradiation for 50 min . The reaction mixture was allowed to cool to room temperature, filtered, and evaporated. The crude product was purified by silica chromatography ( $20-60 \%$ ethyl acetate in isohexane) to afford $48(70 \mathrm{mg}, 39 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.16$ and 1.32 $(9 \mathrm{H}, 2 \times \mathrm{bs}), 1.76(1 \mathrm{H}, \mathrm{bm}), 1.99(1 \mathrm{H}, \mathrm{bm}), 2.26-2.42(4 \mathrm{H}, \mathrm{m}), 6.52$ $(2 \mathrm{H}, \mathrm{s}), 7.16-7.35(9 \mathrm{H}, \mathrm{m}), 7.46(1 \mathrm{H}, \mathrm{bs}), 7.95(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}+)$ $(\mathrm{M}+\mathrm{H})^{+}=417$.

1-(4-(5-Phenylimidazo[1,2-a]pyrazin-6-yl)phenyl)cyclobutanamine Hydrochloride (11). A mixture of 48 ( $75 \mathrm{mg}, 0.2$ mmol ) and aq 2 -chloroacetaldehyde ( $55 \%, 0.21 \mathrm{~mL}, 1.8 \mathrm{mmol}$ ) in dimethylformamide $(2.5 \mathrm{~mL})$ was heated at $70{ }^{\circ} \mathrm{C}$ for 1.5 h . The solution was allowed to cool to room temperature, diluted with ethyl acetate $(25 \mathrm{~mL})$, and washed with saturated aq $\mathrm{NaHCO}_{3}(2 \times 15 \mathrm{~mL})$. The organic layer was dried, filtered, and evaporated and crude product purified by silica chromatography ( $0-3 \%$ methanol in dichloromethane) to afford a pale yellow glassy solid. The solid was dissolved in dichloromethane $(2.5 \mathrm{~mL})$, and HCl in dioxane $(4 \mathrm{M}, 2$ mL ) was added dropwise. The solution was stirred at room temperature for 1 h and then evaporated to dryness to afford 11 $(42 \mathrm{mg}, 56 \%)$ as a pale orange solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.77-1.89(1 \mathrm{H}, \mathrm{m})$, $2.16-2.28(1 \mathrm{H}, \mathrm{m}), 2.54-2.63(4 \mathrm{H}, \mathrm{m}$, partially obscured by DMSO peak), $7.46-7.53(4 \mathrm{H}, \mathrm{m}), 7.58-7.66(6 \mathrm{H}, \mathrm{m}), 7.99(1 \mathrm{H}, \mathrm{s}), 8.72$ $(3 \mathrm{H}, \mathrm{bs}), 9.36(1 \mathrm{H}, \mathrm{s})$; HRMS $m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=341.17612$ (theoretical 341.17607).
tert-Butyl 1-(4-((3-Formylpyridin-4-yl)ethynyl)phenyl)cyclobutylcarbamate (49). A solution of 4-bromoisonicotinaldehyde hydrobromide ( $157 \mathrm{mg}, 0.6 \mathrm{mmol}$ ) and $37(160 \mathrm{mg}, 0.6 \mathrm{mmol})$ in acetonitrile $(6 \mathrm{~mL})$ was degassed with a stream of nitrogen. $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(34 \mathrm{mg}, 0.03 \mathrm{mmol}), \mathrm{CuI}(2.2 \mathrm{mg}, 0.01 \mathrm{mmol})$, and $\mathrm{Et}_{3} \mathrm{~N}$ $(0.25 \mathrm{~mL}, 1.8 \mathrm{mmol})$ were added and the mixture was stirred under nitrogen at room temperature for 4 days. The reaction mixture was filtered and evaporated to dryness. The residue was purified by silica chromatography ( $10-35 \%$ ethyl acetate in isohexane) to afford 49 $(106 \mathrm{mg}, 48 \%)$ as an orange solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.18$ and $1.29(9 \mathrm{H}, 2 \times$ bs), 1.73-1.88 (1H, m), 1.94-2.09 (1H, m), 2.35-2.46 (4H, m), 7.49 $(2 \mathrm{H}, \mathrm{d}), 7.63-7.76(4 \mathrm{H}, \mathrm{m}), 8.84(1 \mathrm{H}, \mathrm{d}), 9.03(1 \mathrm{H}, \mathrm{s}), 10.48(1 \mathrm{H}, \mathrm{s})$; $m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=377$.
tert-Butyl $N$-[1-[4-[2-[3-[(E)-Methoxyiminomethyl]pyridin-4yl]ethynyl]phenyl]cyclobutyl]carbamate (50). To a solution of $49(105 \mathrm{mg}, 0.3 \mathrm{mmol})$ in dichloromethane $(4 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}$ $(0.04 \mathrm{~mL}, 0.3 \mathrm{mmol})$ followed by $O$-methylhydroxylamine hydrochloride $(26 \mathrm{mg}, 0.3 \mathrm{mmol})$. The solution was stirred overnight, diluted with dichloromethane $(15 \mathrm{~mL})$, and washed with water ( 15 $\mathrm{mL})$. The aqueous phase was extracted with dichloromethane $(2 \times 15$ $\mathrm{mL})$. The combined extracts were washed with brine, dried, and evaporated to afford $\mathbf{5 0}(109 \mathrm{mg}, 96 \%)$ as a brown gum. UPLC shows
a mixture of cis and trans oxime isomers: ${ }^{1} \mathrm{H}$ NMR $\delta 1.18$ and 1.29 $(9 \mathrm{H}, 2 \times \mathrm{bs}), 1.72-1.86(1 \mathrm{H}, \mathrm{m}), 1.93-2.08(1 \mathrm{H}, \mathrm{m}), 2.34-2.46(4 \mathrm{H}$, m), $3.99(3 \mathrm{H}, \mathrm{d}), 7.44-7.51(2 \mathrm{H}, \mathrm{m}), 7.56-7.73(4 \mathrm{H}, \mathrm{m}), 8.54(1 \mathrm{H}$, s), $8.58-8.67(1 \mathrm{H}, \mathrm{m}), 8.95(1 \mathrm{H}, \mathrm{s}) ; m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=406$.
tert-Butyl $\quad \mathrm{N}$-[1-[4-(4-Chloro-2,7-naphthyridin-3-yl)phenyl]cyclobutyl]carbamate (51). A solution of $50(107 \mathrm{mg}, 0.3 \mathrm{mmol})$ in DMA $(1.5 \mathrm{~mL})$ and $\mathrm{CuCl}_{2}(71 \mathrm{mg}, 0.5 \mathrm{mmol})$ was heated at $100^{\circ} \mathrm{C}$ for 2 h . The solution was cooled to room temperature, diluted with ethyl acetate $(5 \mathrm{~mL})$, and quenched with water $(5 \mathrm{~mL})$. The mixture was filtered and extracted with ethyl acetate $(2 \times 5 \mathrm{~mL})$, washed with brine, dried, and evaporated. The crude product was purified by silica chromatography ( $20-65 \%$ ethyl acetate in isohexane) to afford 51 (27 $\mathrm{mg}, 25 \%)$ as a colorless crystalline solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.20$ and 1.36 $(9 \mathrm{H}, 2 \times \mathrm{bs}), 1.78-1.92(1 \mathrm{H}, \mathrm{m}), 1.97-2.10(1 \mathrm{H}, \mathrm{m}), 2.40-2.51(4 \mathrm{H}$, m) partially obscured by DMSO peak, $7.53-7.58(2 \mathrm{H}, \mathrm{m}), 7.67(1 \mathrm{H}$, bs), $7.76-7.82(2 \mathrm{H}, \mathrm{m}), 8.12(1 \mathrm{H}, \mathrm{d}), 8.94(1 \mathrm{H}, \mathrm{d}), 9.61(1 \mathrm{H}, \mathrm{d}), 9.65$ $(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=410$.
tert-Butyl $\quad \mathrm{N}$-[1-[4-(4-Phenyl-2,7-naphthyridin-3-yl)phenyl]cyclobutyl]carbamate (52). Toluene ( 1.5 mL ) was added to a mixture of $51(25 \mathrm{mg}, 0.06 \mathrm{mmol})$, phenylboronic acid $(11.2 \mathrm{mg}, 0.1$ $\mathrm{mmol})$, S-Phos $(2.5 \mathrm{mg}, 0.01 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(0.7 \mathrm{mg}, 3.1 \mu \mathrm{~mol})$, and powdered anhydrous potassium orthophosphate $(26 \mathrm{mg}, 0.1$ $\mathrm{mmol})$. The mixture was heated at $80^{\circ} \mathrm{C}$ for 2 h . The reaction mixture was cooled to room temperature, diluted with ethyl acetate ( 6 mL ), filtered, and concentrated. The crude product was purified by silica chromatography ( $0-3.5 \%$ methanol in dichloromethane) to afford 52 $(26 \mathrm{mg}, 94 \%)$ as a colorless gum: ${ }^{1} \mathrm{H}$ NMR $\delta 1.13$ and $1.29(9 \mathrm{H}, 2 \times$ bs), $1.68-1.83(1 \mathrm{H}, \mathrm{m}), 1.90-2.03(2 \mathrm{H}, \mathrm{m}), 2.27-2.40(4 \mathrm{H}, \mathrm{m}), 7.24$ $(2 \mathrm{H}, \mathrm{d}), 7.27-7.32(2 \mathrm{H}, \mathrm{m}), 7.32-7.37(3 \mathrm{H}, \mathrm{m}), 7.39-7.47(3 \mathrm{H}, \mathrm{m})$, $7.46(1 \mathrm{H}, \mathrm{s}), 8.70(1 \mathrm{H}, \mathrm{d}), 9.62(1 \mathrm{H}, \mathrm{d}), 9.66(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}$ $+\mathrm{H})^{+}=452$.

1-(4-(4-Phenyl-2,7-naphthyridin-3-yl)phenyl)cyclobutanamine (15). HCl in dioxane ( $4 \mathrm{M}, 1 \mathrm{~mL}, 4 \mathrm{mmol}$ ) was added dropwise to a solution of $52(25 \mathrm{mg}, 0.06 \mathrm{mmol})$ in dichloromethane $(1 \mathrm{~mL})$, and the resulting yellow suspension was stirred at room temperature for 30 min . The mixture was evaporated to dryness to afford $15(20 \mathrm{mg}, 92 \%)$ as a yellow solid (hydrochloride): ${ }^{1} \mathrm{H}$ NMR $\delta$ 1.71-1.85 $(1 \mathrm{H}, \mathrm{m}), 2.11-2.24(1 \mathrm{H}$, m), 2.49-2.59 ( $4 \mathrm{H}, \mathrm{m}$ ), 7.32-7.38 ( $2 \mathrm{H}, \mathrm{m}$ ), $7.43-7.55(8 \mathrm{H}, \mathrm{m}), 8.74$ $(3 \mathrm{H}, \mathrm{bs}), 8.75(1 \mathrm{H}, \mathrm{d}), 9.81(1 \mathrm{H}, \mathrm{d}), 9.82(1 \mathrm{H}, \mathrm{d}) ; m / z(\mathrm{ES}+)(\mathrm{M}+$ $\mathrm{H})^{+}=352$.
tert-Butyl 1-(4-(3-Chloro-5-cyanopyridin-2-yl)phenyl)cyclobutylcarbamate (53). A solution of 5,6 -dichloropyridine-3carbonitrile ( $80 \mathrm{mg}, 0.5 \mathrm{mmol}$ ), tert-butyl 1-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)cyclobutylcarbamate (173 mg, 0.5 mmol ), and 1,1-bis(di-tert-butylphosphino)ferrocene palladium dichloride ( $30 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) in acetonitrile $(1.5 \mathrm{~mL})$ and aq $\mathrm{K}_{2} \mathrm{CO}_{3}$ $(2 \mathrm{M}, 0.46 \mathrm{~mL}, 0.9 \mathrm{mmol})$ was heated at reflux for 18 h and then allowed to cool to room temperature and filtered. The filtrate was evaporated to dryness and crude product purified by silica chromatography ( $0-1 \%$ methanol in dichloromethane) to afford 53 $(124 \mathrm{mg}, 70 \%)$ as a pale yellow gum; $m / z(\mathrm{ES}-)(\mathrm{M}-\mathrm{tBuOH})^{-}=$ 308.

6-(4-(1-Aminocyclobutyl)phenyl)-5-phenyInicotinamide (26). Toluene $(1 \mathrm{~mL})$ was added to a mixture of $53(60 \mathrm{mg}, 0.2$ $\mathrm{mmol})$, phenylboronic acid ( $29 \mathrm{mg}, 0.2 \mathrm{mmol}$ ), S-Phos $(3.85 \mathrm{mg}, 9.38$ $\mu \mathrm{mol}), \operatorname{Pd}(\mathrm{OAc})_{2}(1 \mathrm{mg}, 4.7 \mu \mathrm{~mol})$, and powdered anhydrous potassium orthophosphate $(66 \mathrm{mg}, 0.3 \mathrm{mmol})$. The mixture was heated at $80{ }^{\circ} \mathrm{C}$ for 2 h . The reaction mixture was allowed to cool to room temperature, diluted with ethyl acetate ( 4 mL ), and filtered. The filtrate was evaporated and the crude product purified by silica chromatography ( $0-15 \%$ ethyl acetate in isohexane) to afford a white solid. The solid was dissolved in dichloromethane ( 1.5 mL ) and methanol $(1.5 \mathrm{~mL})$, then HCl in dioxane ( $4 \mathrm{M}, 6 \mathrm{~mL}, 24 \mathrm{mmol}$ ) was added, and the yellow solution was stirred for 3.5 h . The solution was evaporated to dryness, and the residue was triturated with a mixture of aq $\mathrm{K}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 5 \mathrm{~mL})$ and ethyl acetate $(5 \mathrm{~mL})$, filtered, and washed with water and ethyl acetate to afford $26(34 \mathrm{mg}, 63 \%)$ as a white solid: ${ }^{1} \mathrm{H}$ NMR $\delta 1.59-1.71(1 \mathrm{H}, \mathrm{m}), 1.94-2.15(3 \mathrm{H}, \mathrm{m}), 2.31-2.42$ $(2 \mathrm{H}, \mathrm{m}), 3.09(2 \mathrm{H}, \mathrm{bs}), 7.24-7.40(9 \mathrm{H}, \mathrm{m}), 7.60(1 \mathrm{H}, \mathrm{s}), 8.22(2 \mathrm{H}$,
d), $9.09(1 \mathrm{H}, \mathrm{d}) ;$ HRMS $m / z(\mathrm{ES}+)(\mathrm{M}+\mathrm{H})^{+}=344.17566$ (theoretical 344.175 74).
