#### Abstract

Bcl}-2\) and $\mathrm{Bcl}-\mathrm{xL}$ antiapoptotic proteins are attractive cancer therapeutic targets. We have previously reported the design of 4,5-diphenyl-1 H -pyrrole-3-carboxylic acids as a class of potent $\mathrm{Bcl}-2 / \mathrm{Bcl}-$ xL inhibitors. In the present study, we report our structure-based optimization for this class of compounds based upon the crystal structure of $\mathrm{Bcl}-\mathrm{xL}$ complexed with a potent lead compound. Our efforts accumulated into the design of compound 30 (BM-957), which binds to  Bcl-2 and Bcl-xL with $K_{\mathrm{i}}<1 \mathrm{nM}$ and has low nanomolar $\mathrm{IC}_{50}$ values in cell growth inhibition in cancer cell lines. Significantly, compound 30 achieves rapid, complete, and durable tumor regression in the H 146 small-cell lung cancer xenograft model at a well-tolerated dose schedule.

## - INTRODUCTION

Apoptosis is a tightly regulated cellular process to eliminate damaged and unwanted cells and plays a critical role in normal development and homeostasis of multicellular organisms. Evasion of apoptosis is a hallmark of human cancer, ${ }^{1-3}$ and targeting key apoptotic regulators with the goal of restoring apoptosis in tumor cells is a promising cancer therapeutic strategy. ${ }^{2,4}$

The B-cell lymphoma 2 (Bcl-2) family proteins are key regulators of apoptosis and consist of both proapoptotic and antiapoptotic members. ${ }^{5-7}$ Proapoptotic Bcl-2 proteins are structurally subdivided into two groups: those like Bax, Bak, and Bok, which contain three Bcl-2 homology ( BH ) domains (BH1-BH3), and Bad, Bid, Bim, Bik, Puma, Noxa, and others that contain only the BH3 domain. ${ }^{8}$ Although the precise mechanism of the $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ prosurvival function is not completely understood, it is clear that these proteins inhibit apoptosis by directly binding to and sequestering their prodeath counterparts such as Bim, Bid, and Bad. ${ }^{9} \mathrm{Bcl}-2$ and Bcl-xL are frequently overexpressed in cancer cell lines and human cancer tissues. Such overexpression helps cancer cells suppress a variety of apoptotic stimuli including those associated with cancer chemotherapeutic agents and confers on tumor cells resistance to current therapeutic agents. ${ }^{10,11}$ Thus, inhibition of these antiapoptotic Bcl-2 family members offers an attractive approach for the development of new cancer therapeutics.

Experimentally determined three-dimensional structures of $\mathrm{Bcl}-2$ and its closely related homologous protein $\mathrm{Bcl}-\mathrm{xL}$ showed that the $\mathrm{BH} 1, \mathrm{BH} 2$, and BH 3 domains in these proteins form a well-defined hydrophobic surface binding groove (the BH3 binding groove), which interacts with BH3-only proapoptotic proteins such as Bad, Bid, and Bim. ${ }^{12-14}$ It has been proposed that small-molecule inhibitors designed to bind to the BH3
surface binding groove in $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ will inhibit their antiapoptotic function and promote apoptosis in tumor cells with high expression of these proteins. In the past 10 years, a number of classes of nonpeptide, small-molecule inhibitors have been designed to target the BH3 binding grooves in $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ proteins. ${ }^{15-36}$ ABT-737 (1) and its analogue ABT-263 (2) (Figure 1), from Abbott Laboratories, represent two of the most potent small-molecule inhibitors of $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ proteins reported to date. Both compounds bind to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ with very high affinities ( $K_{\mathrm{i}}<1 \mathrm{nM}$ ) and efficiently induce tumor regression in multiple xenograft tumor models. ${ }^{24-32}$ In phase I/ II clinical trials, ABT-263 shows evidence of promising antitumor activity in patients in chronic lymphocytic leukemia ${ }^{37}$ but has a very limited single-agent activity in patients with small cell lung cancer. ${ }^{38}$

Our laboratory has recently reported the design of compound 3 as a potent $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ inhibitor. ${ }^{39}$ Compound 3 binds to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ with $K_{\mathrm{i}}$ values of $<1 \mathrm{nM}$ and potently inhibits cancer cell growth with $\mathrm{IC}_{50}$ values of approximately 10 nM in multiple cancer cell lines. Compound 3 is also capable of achieving a strong in vivo antitumor activity in the H146 xenograft model in mice at a well-tolerated dose schedule. Although compound 3 shows strong in vivo antitumor activity and in fact induces tumor regression during the treatment in the H146 xenograft tumor model, it fails to achieve durable tumor regression. After the treatment was stopped, tumors quickly regrew, suggesting that further optimization is needed toward our goal of obtaining a highly optimized $\mathrm{Bcl}-2 / \mathrm{Bcl}-\mathrm{xL}$ inhibitor for clinical development. In the present study, we have performed further structure-based optimization for this class of

Figure 2. ( $\mathrm{A}-\mathrm{D)}. \mathrm{Co-crystal}$ structure of compound 4 ( $\mathrm{BM}-903$ ) complexed with Bcl-xL. Compound 4 is colored in yellow, and the surface representation of $\mathrm{Bcl}-\mathrm{xL}$ is shown. Residues interact with the nitro-phenyl, and the thio-phenyl groups on the compounds are labeled. Hydrogen bonds are depicted in dash cyan lines. The modifications are highlighted in $(B-D)$ with a red cycle.
compounds based upon a cocrystal structure (Figure 2) of Bcl-xL complexed with compound 4 (BM-903), an analogue of compound 3. Our efforts accumulated into the design of a new, highly potent $\mathrm{Bcl}-2 / \mathrm{Bcl}-\mathrm{xL}$ inhibitor, which is capable of achieving complete and durable tumor regression in the H146 xenograft tumor model.

## RESULTS AND DISCUSSION

Analysis of the cocrystal structure of compound 4 complexed with $\mathrm{Bcl}-\mathrm{xL}$ showed that the nitro group in 4 binds to a hydrophobic pocket, which can accommodate a larger group than the nitro group (Figure 2B). We have therefore modified the nitro group to determine structure-activity relationship at this site. Because 4 binds to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ with very high affinities ( $K_{\mathrm{i}}$ value $<1 \mathrm{nM}$ to both $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ ), exceeding the lower limits of our binding assays for these two proteins, we
designed and synthesized compound 5 (BM-916, Table 1) as a less potent but more soluble compound and used it as the template for further modifications of the nitro group. Compound 5 has a $K_{\mathrm{i}}$ value of 31.3 nM to $\mathrm{Bcl}-2$ and 37.7 nM to $\mathrm{Bcl}-\mathrm{xL}$, respectively (Table 1).

To determine the contribution of the nitro group, we first synthesized compound 6 in which the nitro group is replaced with a hydrogen atom. Compound $\mathbf{6}$ is 18 and 30 times less potent than 5 in its binding affinities to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$, respectively, confirming the importance of the nitro group.

Because the nitro group inserts into a small hydrophobic pocket in $\mathrm{Bcl}-\mathrm{xL}$ in the crystal structure of 4 complexed with Bcl xL (Figure 2), we designed and synthesized a series of analogues of 5 by replacing the nitro group with a small hydrophobic group. These include $\mathbf{7 - 9}$, in which the nitro group is replaced with a halogen atom ( $\mathrm{F}, \mathrm{Cl}$, and Br ), 10-13, in which the nitro group is
replaced with a small alkyl group, 14-17 with a small alkyloxyl group, and 18-21 with an alkylsulfonyl group. The binding data (Table 1) show that, with the exception of compounds 9 and 18, in which the nitro group is replaced by Br and trifluoromethylsulfonyl, respectively, these analogues bind to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-$ xL 5-20 times less potently than 5 . While 9 is still slightly less potent than $\mathbf{5 , 1 8}$ is as potent as $\mathbf{5}$ in binding to both $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$.

Having identified trifluoromethylsulfonyl as a suitable replacement group for the nitro group for effective interaction with both $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$, we next synthesized 22, in which the nitro group in 4 is replaced with trifluoromethylsulfonyl. Compound 22 binds to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ with high affinities ( $K_{\mathrm{i}}=2.1 \mathrm{nM}$ for Bcl-2 and $<1 \mathrm{nM}$ for Bcl-xL). Similarly to 3 and 4, compound 22 has no appreciable binding to Mcl-1 at concentrations as high as $5 \mu \mathrm{M}$, indicating that it is a potent and specific Bcl-2/Bcl-xL inhibitor.

We next evaluated $\mathbf{2 2}$ for its activity in inhibition of cell growth in the H1417 and H146 small-cell lung cancer cell lines, which are sensitive to potent and specific $\mathrm{Bcl}-2 / \mathrm{Bcl}-\mathrm{xL}$ inhibitors such as compounds $\mathbf{1}-4 .{ }^{24,27,39}$ Compound 22 potently inhibits cell growth in the H1417 and H146 cancer cell lines, with $\mathrm{IC}_{50}$ values of 151 and 98 nM , respectively. The binding and cellular data thus indicated that 22 is a promising lead compound for further modifications.

The cocrystal structure (Figure 2C) also showed that the dimethylamino group of compound 4 forms hydrogen bonds with side chains of E96 and Y195 residues of Bcl-xL. We next modified the dimethylamino group in 22 using different sized nitrogen containing rings with or without a hydroxyl group. Compound 23 with morpholinyl shows weaker binding affinity than 22 to Bcl-2, but all other compounds have similar potencies to both $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ as compared to 22. Consistent with its weaker binding affinity to $\mathrm{Bcl}-2$, compound 23 is $3-5$ times less potent than 22 in inhibition of cell growth in both H146 and H1417 cancer cell lines. All other compounds show similar potencies, with $\mathrm{IC}_{50}$ values of $100-200 \mathrm{nM}$ in inhibition of cell growth in the H1417 and H146 cell lines.

In our subsequent in vivo evaluation, we found that compound 28 is effective in inhibition of tumor growth in the H146 tumor xenograft model at a well-tolerated dose-schedule (see below). Therefore, we focused subsequent modifications on 28.

The cocrystal structure (Figure 2D) shows that the $N$-methyl group in the core structure of compound 4 inserts into the welldefined hydrophobic pocket formed by L112, V126, and F146 in Bcl-xL, and there is more space available in this pocket to accommodate a larger hydrophobic group than methyl. We therefore probed this hydrophobic binding pocket by replacing the methyl in compound 28 with ethyl, propyl, isopropyl, and butyl groups (Table 3). Compound $\mathbf{3 0}$ with ethyl and compound 31 with isopropyl bind to both $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ with very high affinities. While 30 and 31 bind to $\mathrm{Bcl}-2$ with $\mathrm{IC}_{50}$ values of 5.4 and 4.0 nM , respectively ( $K_{\mathrm{i}}$ values $=1.2$ and 0.8 nM , respectively), they bind to $\mathrm{Bcl}-\mathrm{xL}$ with $\mathrm{IC}_{50}$ values of 6.0 and 3.9 nM , respectively ( $K_{\mathrm{i}}$ values $<1 \mathrm{nM}$ ). However, compound 32 with propyl and compound 33 with butyl have lower affinities to $\mathrm{Bcl}-2$ than 30 and 31. Interestingly, these four compounds have similar high binding affinities to $\mathrm{Bcl}-\mathrm{xL}$. Similar to 22 , compounds 28-33 have no appreciable binding to $\mathrm{Mcl}-1$ at concentrations as high as $5 \mu \mathrm{M}$.

Testing of compounds $30-33$ in the H1417 and H146 cell lines showed that these compounds are very potent in inhibition of cell growth and are 5-10 times more potent than 28 . While 30
has $\mathrm{IC}_{50}$ values of 21 and 22 nM , respectively, in these two cancer cell lines, compound 31 has $\mathrm{IC}_{50}$ values of 9 and 13 nM , respectively. However, compounds 32 and 33 are $>10$ times less potent than 30 and 31.

Further in Vitro Evaluations of Potent $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ Inhibitors. We next tested compounds 28, 30, and 31 for their ability to induce cell death in the H146 cancer cell line, in direct comparison to compounds $\mathbf{1}$ and $\mathbf{2}$. The results are shown in Figure 3.

Figure 3. Induction of cell death by compounds 1, 2, 28, 30, and 31 in the H146 cell line. Cells were treated with different concentrations of the compounds for 24 h . Cell viability was determined using a trypan blue exclusion assay.

All these compounds induce cell death in a dose-dependent manner but have different potencies. While 28 is somewhat less potent than $\mathbf{1}$ and 2, 30 and 31 are several times more potent than 1 and 2. For example, 30 and 31 at 10 nM with 24 h treatment induces $>50 \%$ of the H146 cells to undergo cell death, whereas $\mathbf{1}$ and 2 at $30-100 \mathrm{nM}$ have a similar effect.

We further tested compounds 2, 28, and 30 in the H146 cell line for their ability to induce cleavage of poly(ADP-ribose) polymerase (PARP) and caspase-3, two key biochemical markers of apoptosis. The results are shown in Figure 4. Compound 30 at $10 \mathrm{nM}, 28$ at 100 nM , and 2 at 30 nM all induce clear cleavage of PARP and activation of caspase- 3 and have similar effects. Hence, the potencies for these three compounds in induction of cleavage

Figure 4. Western blot analysis of biochemical markers of apoptosis in H146 cancer cells treated with compounds 2, 28, and 30. H146 cancer cells were treated with indicated concentrations of each compound for 24 h. PARP, cleaved PARP (Cl PARP), caspase-3, and cleaved caspase-3 (Cl Cas-3) were probed with specific antibodies. GAPDH was used as the loading control.

Figure 5. Induction of cleavage of PARP and caspase-3 in H146 xenograft tumors by compounds 28 and 30. SCID mice bearing H146 xenograft tumors $\left(100-200 \mathrm{~mm}^{3}\right)$ were treated with vehicle control, single dose of $28(50 \mathrm{mg} / \mathrm{kg}$, iv) or $30(25 \mathrm{mg} / \mathrm{kg}$, iv). Mice were sacrificed at indicated time-point and tumors were removed for Western blot analysis of cleavage of PARP and caspase-3. Cl PARP, cleaved PARP; Cl Caspase-3, cleaved Caspase-3.

Figure 6. Antitumor activity of compounds 28 and 30 in H146 xenograft tumors model in two separate experiments. SCID mice bearing xenograft tumors ( $\sim 100 \mathrm{~mm}^{3}$ ) were treated with vehicle control, compound 28 at $50 \mathrm{mg} / \mathrm{kg}$ (iv) or compound $30 \mathrm{at} 25 \mathrm{mg} / \mathrm{kg}$, (iv), daily, 5 days a week for two weeks.
of PARP and activation of caspase-3 in the H146 cells are consistent with their potencies in induction of cell death.

In Vivo Evaluation of Compounds 28, 30, and 31. We determined the maximum tolerated dose (MTD) for compounds 28, 30, and 31 in severe combined immunodeficiency (SCID) mice. It was found that 28 at $50 \mathrm{mg} / \mathrm{kg}, \mathbf{3 0}$ at $25 \mathrm{mg} / \mathrm{kg}$, and 31 at $10 \mathrm{mg} / \mathrm{kg}$, daily intravenous (iv) dosing 5 days a week for 2 weeks were well tolerated in SCID mice and the animals had less than $10 \%$ weight loss. Higher doses of these compounds $(75 \mathrm{mg} / \mathrm{kg}$ for $28,50 \mathrm{mg} / \mathrm{kg}$ for 30 , and $25 \mathrm{mg} / \mathrm{kg}$ for 31 ) caused more than $10 \%$ of weight loss. These experiments established the MTDs for these three compounds in SCID mice for our subsequent pharmacodynamics (PD) and efficacy experiments. On the basis of the toxicity data, we decided to further evaluate compounds 28 and 30 for their in vivo antitumor activity.

We tested compounds 28 and 30 for their ability to induce cleavage of PARP and activation of caspase-3 in the H146 xenograft tumor tissue in mice at their respective MTD in a pharmacodynamics experiment. Mice bearing H 146 tumors were given a single iv dose of 28 at $50 \mathrm{mg} / \mathrm{kg}$ or 30 at $25 \mathrm{mg} / \mathrm{kg}$. The mice were then sacrificed at 3,6 , and, 24 h time points, and tumors were harvested for analysis. Western blotting analysis showed that while both 28 and 30 effectively induce robust cleavage of PARP in H146 tumor tissues at 3 and 6 h time points, 30 is much more effective than 28 in induction of cleavage of caspase-3 (Figure 5). These data suggested that while both compounds induce apoptosis in tumor tissues, $\mathbf{3 0}$ is clearly more effective than 28.

On the basis of the encouraging in vivo pharmacodynamic data, we next evaluated 28 and $\mathbf{3 0}$ for their antitumor efficacy in the H146 xenograft tumor model (Figure 6). Our data showed that although compound 28 at $50 \mathrm{mg} / \mathrm{kg}$ effectively inhibits tumor growth, it fails to induce tumor regression. In contrast, compound 30 at $25 \mathrm{mg} / \mathrm{kg}$ achieved rapid and complete tumor
regression. Of seven mice treated with $\mathbf{3 0}$, all mice were still tumor-free at day 47 ( 15 days post-treatment) and five (71\%) remained tumor-free on day 58 ( 28 days post-treatment). Similar to the data obtained from our MTD experiment, both compounds 28 and 30 are well tolerated in tumor-bearing animals. All treated animals experienced less than $10 \%$ weight loss compared to the vehicle control, and all regained their weight quickly after the treatments were finished. This in vivo experiment thus established that 30 achieves complete and durable tumor regression in the H146 xenograft tumor model and is more efficacious than 28.

Synthesis of Designed Bcl-2 Family Protein Inhibitors. The general synthetic route to compounds in Tables 1 and 2 is shown in Scheme 1. Compound 34, which was prepared according to a previously reported method, ${ }^{39}$ was coupled with 3-(4-methyl-piperazin-1-yl)-propylamine to give phenylnitro 35. Reduction of the phenylnitro under hydrogen atmosphere in the presence of $\mathrm{Pd} / \mathrm{C}$ yielded the corresponding aniline, which was subjected to different $m$-substituted benzenesulfonyl chloride in pyridine to generate compounds in Table 1.

Using a converged synthetic strategy, compounds in Table 2 were prepared by coupling amine $37 \mathrm{a}-\mathrm{f}$ with highly activated fluoro containing intermediate 38. Amine 37a-f were obtained by treatment of $\mathbf{3 6}$ with different amines, followed by removal of the Fmoc group with $\mathrm{Et}_{2} \mathrm{NH}$ and reduction with borane. Phenylnitro 34 was reduced by hydrogenation and then treated with commercially available 4-fluoro-3(trifluoromethylsulfonyl)benzenesulfonyl chloride to yield 38.

The general synthetic route for compounds in Table 3 is shown in Scheme 2. Briefly, condensation of 39 with primary amines resulted in pyrrole 40a-b. Phenylnitro 41a-b were prepared by Ullman coupling of 1-( $p$-nitrophenyl)piperazine with $\mathbf{4 0 a}-\mathbf{b}$, followed by hydrolysis of these ethyl esters, which yielded free carboxylic acid $\mathbf{4 2 a} \mathbf{a} \mathbf{b}$. Reduction of the nitro group

Table 1. Structure-Activity Relationships of the Nitro Group Replacements

of $\mathbf{4 2 a - b}$ and $\mathbf{4 2 c} \mathbf{c}$, ${ }^{39}$ followed by coupling of 4-fluoro-3-(trifluoromethylsulfonyl)benzene-1-sulfonyl chloride, yielded sulfonanilide 43a-d, treatment of which with 37 e in the presence of DIPEA in DMF gave compounds in Table 3.

## SUMMARY

We have performed further structure-based optimization for a new class of $\mathrm{Bcl}-2 / \mathrm{Bcl}-\mathrm{xL}$ inhibitors containing 4,5-diphenyl-1H-pyrrole-3-carboxylic acid as the core structure. Our efforts accumulated into the design of compound 30 (BM-957), which binds to $\mathrm{Bcl}-2$ and $\mathrm{Bcl}-\mathrm{xL}$ with the $K_{\mathrm{i}}$ values $<1 \mathrm{nM}$ and shows potent activity in cell growth inhibition in cancer cell lines, with $\mathrm{IC}_{50}$ values of $\sim 20 \mathrm{nM}$ against the H1147 and H146 small-cell lung cancer cell lines. Compound 30 induces robust cleavage of PARP and caspase- 3 in 24 h at concentrations as low 10 nM in
the H146 cell line. In vivo, compound $\mathbf{3 0}$ achieves complete and durable tumor regression in H146 xenograft tumors and is thus more efficacious than compound 3 in the same tumor model. The efficacy data thus suggest that compound $\mathbf{3 0}$ has a superior pharmacokinetic property to compound 3. Taken together, compound 30 represents a promising $\mathrm{Bcl}-2 / \mathrm{Bcl}-\mathrm{xL}$ inhibitor for extensive evaluations as a new anticancer agent.

## EXPERIMENTAL SECTION

Chemistry: General Methods. Unless otherwise noted, all reactions were performed under nitrogen atmosphere in dry solvents under anhydrous conditions and reagents were used as supplied without further purification. NMR spectra were acquired at a proton frequency of 300 MHz , and chemical shifts are reported in parts per million (ppm) relative to an internal standard. The final products were purified by a

## Scheme 2. Synthesis of Compounds 30-33 in Table 3

Reagents and conditions: (a) amines, MeOH , room temp; (b) 1-(4-nitrophenyl)piperazine, CuI, L-proline, $\mathrm{K}_{2} \mathrm{CO}_{3}, 100{ }^{\circ} \mathrm{C}$; (c) excess $\mathrm{NaOH}, 1: 1: 1$ Dioxane, $\mathrm{EtOH}, \mathrm{H}_{2} \mathrm{O}$, reflux; (d) (i) $\mathrm{Pd} / \mathrm{C}, \mathrm{H}_{2}, \mathrm{MeOH}$, room temp; (ii) 4-fluoro-3-(trifluoromethylsulfonyl)benzene-1-sulfonyl chloride, $\mathrm{Py}, 0^{\circ} \mathrm{C}$; (e) 37e, DIPEA, DMF, room temp.
with $\mathrm{EtOAc}(200 \mathrm{~mL})$, washed sequentially with $1 \mathrm{M} \mathrm{HCl}(50 \mathrm{~mL})$, $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$, and brine $(20 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated. The concentrate was flash chromatographed on silica gel with $5 \% \mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ to provide $1.15 \mathrm{~g}(86 \%)$ of $35 .{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.14(\mathrm{~d}, J=10.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.27-7.05(\mathrm{~m}, 5 \mathrm{H}), 6.89-$ $6.68(\mathrm{~m}, 5 \mathrm{H}), 3.53-3.47(\mathrm{~m}, 4 \mathrm{H}), 3.42(\mathrm{~s}, 3 \mathrm{H}), 3.26-3.19(\mathrm{~m}, 6 \mathrm{H})$, $2.61(\mathrm{~s}, 3 \mathrm{H}), 2.45-2.09(\mathrm{~m}, 8 \mathrm{H}), 2.24(\mathrm{~s}, 3 \mathrm{H}), 2.11(\mathrm{t}, J=6.4,2 \mathrm{H})$, $1.50-1.41(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 165.99,154.57$, 150.26, 138.54, 135.84, 133.68, 133.31, 132.28, 130.58, 129.41, 129.17, 128.42, 125.88, 122.37, 121.04, 118.58, 114.83, 114.33, 112.67, 55.90, 55.07, 53.48, 53.03, 48.39, 46.72, 46.00, 37.63, 31.58, 26.47, 11.40. MS (ESI): $m / z 670.92(\mathrm{M}+\mathrm{H})^{+}$.

General Procedure I. 5-(4-Chlorophenyl)-1,2-dimethyl-N-(3-(4-methylpiperazin-1-yl) propyl)-4-(3-(4-(4-(3-nitrophenylsulfonamido)phenyl)piperazin-1-yl)phenyl)-1H-pyrrole-3-carboxamide (5). To a solution of $35(100 \mathrm{mg}, 0.15 \mathrm{mmol})$ in 15 mL of methanol was added $10 \%$ wt $\mathrm{Pd} / \mathrm{C}(10 \mathrm{mg}, 0.1$ equiv $\mathrm{m} / \mathrm{m})$. The solution was stirred under hydrogen atmosphere for about 20 min at
room temperature until no 35 was observed by TLC. The reaction mixture was filtered, and the filtrate was concentrated in vacuum. The residue was used for next step directly without purification. To the solution of this aniline in pyridine, 3-nitrobenzene-1-sulfonyl chloride $(40 \mathrm{mg}, 0.18 \mathrm{mmol})$ was added at $0^{\circ} \mathrm{C}$. The mixture was stirred at $0^{\circ} \mathrm{C}$ to room temperature for 1 h until no aniline was observed by TLC. $\mathrm{H}_{2} \mathrm{O}$ $(10 \mathrm{~mL})$ was added, and the mixture was extracted with $\mathrm{EtOAc}(2 \times 30$ $\mathrm{mL})$. The EtOAc solution was washed with brine $(50 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The concentrate was purified by HPLC to give the pure product 5 (as the trifluoroacetate salt, 89 mg ), yield $72 \%$, over two steps. The gradient ran from $80 \%$ of solvent A and $20 \%$ of solvent $B$ to $40 \%$ of solvent A and $60 \%$ of solvent $B$ in $40 \mathrm{~min} .{ }^{1} \mathrm{H}$ NMR ( $\left.300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right): \delta 8.44-8.39(\mathrm{~m}, 2 \mathrm{H}), 8.09-8.06(\mathrm{~m}, 1 \mathrm{H})$, $7.75(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-7.22(\mathrm{~m}, 3 \mathrm{H}), 7.14-7.04(\mathrm{~m}, 7 \mathrm{H}), 6.86(\mathrm{t}$, $J=2.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.51(\mathrm{br}, 4 \mathrm{H}), 3.42-3.34(\mathrm{~m}, 17 \mathrm{H}), 2.97(\mathrm{t}, J=7.3 \mathrm{~Hz}$, $2 \mathrm{H}), 2.92(\mathrm{~s}, 3 \mathrm{H}), 2.45(\mathrm{~s}, 3 \mathrm{H}), 1.87-1.83(\mathrm{~m}, 2 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}): m / z$ $826.00(\mathrm{M}+\mathrm{H})^{+}$.

General Procedure IV. Ethyl 5-(4-Chlorophenyl)-4-(3-iodophen-yll-2-methyl-1-propyl-1H-pyrrole-3-carboxylate (40a). To the solution of $39(2.0 \mathrm{~g}, 4.1 \mathrm{mmol})$ in $\mathrm{MeOH}(20 \mathrm{~mL})$ was added propylamine $(1.0 \mathrm{~mL}, 12.3 \mathrm{mmol})$, and the solution was stirred for 6 h at room temperature until no starting material was observed by TLC. The solution was acidified with $1 \mathrm{M} \mathrm{HCl}(50 \mathrm{~mL})$ and extracted with EtOAc $(2 \times 50 \mathrm{~mL})$. The combined EtOAc solutions were washed with brine $(50 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated in vacuo. The concentrate was flash chromatographed on silica gel with $10 \% \mathrm{EtOAc} /$ hexane to provide 1.89 g of $40 \mathrm{a}(91 \%) .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.52(\mathrm{t}, J=$ $1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.46-7.42(\mathrm{~m}, 1 \mathrm{H}), 7.28-7.24(\mathrm{~m}, 2 \mathrm{H}), 7.08-6.94(\mathrm{~m}$, $3 \mathrm{H}), 6.84(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.08(\mathrm{dd}, J=14.3,7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.73(\mathrm{t}, J=$ $7.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.61(\mathrm{~s}, 3 \mathrm{H}), 1.58-1.46(\mathrm{~m}, 2 \mathrm{H}), 1.04(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$, $0.75(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 165.60,139.89$, $138.20,136.00,134.64,133.88,132.60,130.30,130.17,129.77,128.79$, 128.56, 122.57, 111.21, 92.91, 59.30, 45.83, 24.01, 14.03, 11.69, 11.07.

Ethyl 1-Butyl-5-(4-chlorophenyl)-4-(3-iodophenyl)-2-methyl-1H-pyrrole-3-carboxylate (40b). 40b was prepared from 39 and butylamine according to general procedure IV. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ : $\delta 7.52(\mathrm{~s}, 1 \mathrm{H}), 7.43(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.26(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.06(\mathrm{~d}$, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.95(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.84(\mathrm{t}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.07$ (dd, $J=14.4,7.3 \mathrm{~Hz}, 2 \mathrm{H}), 3.76(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.62(\mathrm{~s}, 3 \mathrm{H}), 1.53-$ $1.43(\mathrm{~m}, 2 \mathrm{H}), 1.22-1.09(\mathrm{~m}, 2 \mathrm{H}), 1.04(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 0.78(\mathrm{t}, J=7.3$ $\mathrm{Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 165.60,139.90,138.21,135.96$, 134.63, 133.88, 132.62, 130.29, 130.14, 129.78, 128.79, 128.55, 122.56, 111.21, 92.92, 59.30, 44.05, 32.77, 19.79, 14.04, 13.55, 11.70.

General Procedure V. Ethyl 5-(4-Chlorophenyl)-2-methyl-4-(3-(4-(4-nitrophenyl)piperazin-1-yl)phenyl)-1-propyl-1H-pyrrole-3-carboxylate (41a). Ester 40a ( $1.52 \mathrm{~g}, 3.0 \mathrm{mmol}$ ), 1-(4-nitrophenyl)piperazine ( $1.87 \mathrm{~g}, 9.0 \mathrm{mmol}$ ), $\mathrm{CuI}(57 \mathrm{mg}, 0.3 \mathrm{mmol})$, t-proline ( 173 $\mathrm{mg}, 1.5 \mathrm{mmol})$, and $\mathrm{K}_{2} \mathrm{CO}_{3}(1.24 \mathrm{~g}, 9.0 \mathrm{mmol})$ were dissolved in 30 mL of DMSO. This solution was stirred for 8 h under a nitrogen atmosphere at $80^{\circ} \mathrm{C}$ until no 40 a was observed by TLC. The reaction mixture was cooled, saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 50 mL ) was added, and the solution extracted with EtOAc $(2 \times 50 \mathrm{~mL})$. The combined EtOAc solutions were washed with brine $(50 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated in vacuo. The concentrate was flash chromatographed on silica gel with $40 \% \mathrm{EtOAc} /$ hexane to provide 1.44 g of 41a ( $82 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.14-8.09(\mathrm{~m}, 2 \mathrm{H}), 7.26-7.06(\mathrm{~m}, 5 \mathrm{H}), 6.86-6.62$ $(\mathrm{m}, 5 \mathrm{H}), 4.09(\mathrm{dd}, J=14.2,7.08 \mathrm{~Hz}, 2 \mathrm{H}), 3.75(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 3.48$ $(\mathrm{t}, J=4.9 \mathrm{~Hz}, 4 \mathrm{H}), 3.15(\mathrm{t}, J=5.3 \mathrm{~Hz}, 4 \mathrm{H}), 2.62(\mathrm{~s}, 3 \mathrm{H}), 1.61-1.48(\mathrm{~m}$, $2 \mathrm{H}), 1.05(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 0.76(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 165.88,154.75,149.55,138.55,136.55,135.45,133.55$, 132.68, 131.00, 129.94, 128.43, 127.88, 125.93, 124.32, 123.39, 119.32, 114.08, 112.69, 111.39, 59.26, 49.01, 46.90, 45.86, 24.06, 14.06, 11.7, 11.08. Fluorescence Polarization-Based Binding Assays for Bcl-2, $\mathrm{Bcl}-\mathrm{xL}$, and Mcl-1 Proteins. The binding assays for $\mathrm{Bcl}-2, \mathrm{Bcl}-\mathrm{xL}$ and Mcl-1 proteins were the same as those described in our previous publications. ${ }^{39,40}$

Cell Death Assay. Cell death assays were performed using trypan blue staining. Cells were treated with the indicated compounds. At the end of treatment, cells were collected and stained with trypan blue. Cells that stained blue or the morphologically unhealthy cells were scored as dead cells. At least 100 cells were counted for each sample.

Western Blotting. Cells were lysed using radioimmunoprecipitation assay lysis buffer (PBS containing $1 \%$ NP40, $0.5 \%$ sodium deoxycholate, and $0.1 \%$ SDS) supplemented with $1 \mu \mathrm{~mol} / \mathrm{L}$ phenylmethylsulfonyl fluoride and one protease inhibitor cocktail tablet per 10 mL on ice for 20 min , and lysates were then cleared by centrifugation before protein concentration determination using the Bio-Rad protein assay kit according to the manufacturer's instructions. Proteins were electrophoresed onto $4-20 \%$ SDS-PAGE gels (Invitrogen) and transferred onto polyvinylidenedifluoride membranes. Following blocking in $5 \%$ milk, membranes were incubated with a specific primary antibody, washed, and incubated with horseradish peroxidase-linked secondary antibody (Amersham). The signals were visualized with the chemiluminescent horseradish peroxidase antibody detection reagent (Denville Scientific). Rabbit antibodies against PARP and caspase- 3 are from Cell Signaling Technology. Rabbit anti-GAPDH is from Santa Cruz Biotechnology.

Efficacy Studies. When tumors reached tumor volumes between 40 and $110 \mathrm{~mm}^{3}$, mice were randomized into different groups, eight mice per group, with a mean tumor volume of $70 \mathrm{~mm}^{3}$. Mice were treated with compound 28 at $50 \mathrm{mg} / \mathrm{kg}$, or compound 30 at $25 \mathrm{mg} / \mathrm{kg}$, intravenously, daily, 5 days a week for 2 weeks, or vehicle control. Tumor sizes and animal weights were measured 3 times a week during the treatment and twice a week after the treatment. Data are presented as mean tumor volumes $\pm$ SEM. Statistical analyses were performed by two-way ANOVA and unpaired two-tailed $t$ test, using Prism (version 4.0, GraphPad, La Jolla, CA). $P<0.05$ was considered statistically significant. The efficacy experiment was performed under the guidelines of the University of Michigan Committee for Use and Care of Animals.

## ASSOCIATED CONTENT

## Accession Codes

Coordinates for $\mathrm{Bcl}-\mathrm{xL}$ complexed with 4 were deposited into the Protein Data Bank with accession number 3SPF.

## Notes

The authors declare the following competing financial interest(s): Dr. Wang is a co-founder of Ascentage, which has licensed the Bcl-2/Bcl-xL inhibitors described in the manuscript. Dr. Wang serves as an officer in Ascentage and owns stocks in Ascentage.

## ACKNOWLEDGMENTS

This research was supported in part by a grant from the National Cancer Institute, National Institutes of Health (U19CA113317). Use of the Advanced Photon Source was supported by the U.S. Department of Energy, Office of Science, Office of Basic Energy Sciences, under contract no. DE-AC02-06CH11357. Use of the LS-CAT Sector 21 was supported by the Michigan Economic Development Corporation and the Michigan Technology TriCorridor for the support of this research program (grant 085P1000817).

## ABBREVIATIONS USED

Bcl-2, B-cell lymphoma 2; Bax, Bcl-2 related protein X; Bak, Bcl-2 antagonist/killer; Bok, Bcl-2-related ovarian killer protein; Bad, $\mathrm{Bcl}-2$ antagonist of cell death; Bid, BH 3 interacting death domain; Bim, Bcl-2 interacting mediator; Bik, bcl-2 interacting killer; Puma, p53 upregulated modulator of apoptosis; Bcl-xL, Bcell lymphoma $x$ long; $\mathrm{BH}, \mathrm{Bcl}$ homology; PARP, poly(ADPribose) polymerase; SCID, severe combined immunodeficiency; EDCI, $N$-(3-Dimethylaminopropyl)- $N^{\prime}$-ethylcarbodiimide hydrochloride; HOBT, 1-hydroxybenzotriazole hydrate; DIPEA, $N, N$-diisopropylethylamine; FPA, fluorescence polarization assay
