# PEREZONE AND RELATED SESQUITERPENES FROM PARVIFOLINE 

E. García G., V. Mendoza, and A. Guzmán B.<br>Instituto de Investigaciones Quimico-Biológicas, Universidad Michoacana de San Nicolás de Hidalgo, P.O. Box 59-A, Morelia, Michoacán, México

#### Abstract

The previously known sesquiterpenes, curcuhydroquinone [5b], curcuquinone [6a], xanthorrhizol [5a], perezone \{6c], isoperezone [6b], and hydroxyperezone [ $\mathbf{6 d}$ ] were obtained in good yields from parvifoline [1]. The chiral center in parvifoline is assigned the $R$ configuration based on these conversions.

A large number of natural products containing the quinone functionality have shown useful chemotherapeutic activity ( 1,2 ). As a result of the utility of these compounds, intense synthetic efforts have been directed toward the development of methods that would permit construction of natural quinones (3-7) or the regioselective introduction of functionality into the quinone system. We wish to report the preparation of the benzoquinones perezone $[\mathbf{6 c}]$ (8), isoperezone [6b] (9), hydroxyperezone $[\mathbf{6 d}](10)$, and curcuquinone $[\mathbf{6 a}]$ (11), and the sesquiterpene xanthorrhizol [5a] (12) from parvifoline [1] (13,14), which was obrained as a major component ( $15 \%$ ) of Pereziae spp. (15).

Parvifoline [1] can be isomerized by acid catalysis to isoparvifoline [2], the ozonolysis of which produces the aldehyde 3a. This is a key compound for the preparation of the sesquiterpenes mentioned previously, since its aromatic ring has a methyl group para to the side chain. This side chain has a chiral center that is not involved in the synthetic pathways to those sesquiterpenes.

Treatment of 3a by Dakin's reaction (16) gave hydroquinone $4 \mathbf{a}$ and this, with $\mathrm{CH}_{3} \mathrm{MgI}$ (17) followed by dehydration, gave ( - -curcuhydroquinone [5b]. In agreement with the chemical correlation made by McEnroe (11), we obtained $[\alpha]^{25} \mathrm{D}-36$ (c $2.3, \mathrm{CHCl}_{3}$ ) indicating that the previously unassigned stereochemistry of $\mathrm{C}-8$ of parvifoline $[\mathbf{1}]$ (13) is the $R$ configuration. Treatment of curcuhydroquinone $[\mathbf{5 b}]$ with Jones reagent yielded curcuquinone $\{\mathbf{6 a}]$ (11), while $\mathbf{5 b}$ by previously reported reaction with $\mathrm{H}_{2} \mathrm{O}_{2} / \mathrm{NaOH}$ yielded hydroxyperezone [ $\left.\mathbf{6 d}\right]$ (18).

Oxidation (19) and decarboxylation (20) of aldehyde 3a produced 5-( $2^{\prime}$-ketohep-tan- $6^{\prime}$-yl)-2-methylphenol, which can also be prepared by direct decarbonylation of 3a with Wilkinson's reagent $(21,22)$. Reactions of this intermediate with $\mathrm{CH}_{3} \mathrm{MgI}$ followed by dehydration gave xanthorrhizol [5a], identical with the natural product (12).

Aldehyde $3 \mathbf{a}$ with $\mathrm{Me}_{2} \mathrm{SO}_{4}$ produces methoxyaldehyde $\mathbf{3 b}$, which by a modification of Dakin's reaction (23) with catalytic $\mathrm{SeO}_{2}$, afforded methoxyphenol $\mathbf{4 b}$. This compound with $\mathrm{CH}_{3} \mathrm{MgI}$ and dehydration gave 4-0-methylcurcuhydroquinone [5c]. Hydroxylation ortho to the free hydroxyl group with $\mathrm{Cu}_{2} \mathrm{Cl}_{2}$ in $\mathrm{MeCN}(24,25)$ occurs smoothly and in good yield to produce the corresponding catechol $\mathbf{5 d}$, which by oxidative demethylation (26) with $\mathrm{AgO} / \mathrm{HNO}_{3}$ produced isoperezone $[\mathbf{6 b}]$ as previously reported.

Perezone $\{\mathbf{6 c}\}$ was obtained by treatment of $\mathbf{3 a}$ under the same conditions $\left(\mathrm{Cu}_{2} \mathrm{Cl}_{2} /\right.$ MeCN ) (23) followed by Dakin's reaction (16) to give a hydroxyhydroquinone, which was not isolated. Grignard reaction with excess $\mathrm{CH}_{3} \mathrm{MgI}$ on this compound, dehydration, and subsequent oxidation gave perezone $[\mathbf{6 c}]$ identical with the natural product (8).

As parvifoline $[\mathbf{1}]$ is easily obtained in very high yields from certain Pereziae spp. and can be easily functionalized, it can serve as a starting material for other sesquiterpenes having the same $R$ configuration of the chiral center.

## EXPERIMENTAL

Melting points are uncorrected. Ir spectra were carried out on a Perkin-Elmer 599B; ${ }^{1} \mathrm{H}$-nmr spectra were determined in $\mathrm{CDCl}_{3}$ with internal TMS on a Varian Associates EM-360. Optical rotations, measured by using a Perkin-Elmer 121 M polarimeter, were performed at room temperature. High resolution mass spectra were measured in a Finnigan MAT-311A.

Parvifoline [1].-The dried and ground roots ( 1 kg ) of Pereziae longifolia Blake (Compositae) were extracted twice with hexane ( 5 liters) under reflux for 4 h , and the combined extracts were evaporated to dryness. The solid obtained was recrystallized from $\mathrm{C}_{6} \mathrm{H}_{6} / \mathrm{Me}_{2} \mathrm{CO}$ to yield 138 g ( $13.8 \%$ ) of parvifoline [1] identical in all respects with authentic samples (14).

IsOparvifoline [2].-A solution containing 100 g of parvifoline [1] and catalytic $p$ - TsOH in $\mathrm{C}_{6} \mathrm{H}_{6}$ was heated at reflux for 3 h . The reaction mixture was washed (dilute $\mathrm{NaHCO}_{3}$ and $\mathrm{H}_{2} \mathrm{O}$ ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and evaporated. The residue was chromatographed $\left(\mathrm{SiO}_{2}\right)$; elution with $\mathrm{C}_{6} \mathrm{H}_{6}$ yielded 99 g of isoparvifoline [2] as a colorless oily material that showed ir bands at $3500(\mathrm{O}-\mathrm{H})$ and $1650 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{C})$; ${ }^{1} \mathrm{H} \mathrm{nmr} 5.56,6.33$, and 5.93 ( 1 H each, $\mathrm{s}, \mathrm{H}-1, \mathrm{H}-4$, and $\mathrm{H}-11$ ), $5.00(1 \mathrm{H}$, broad s, OH ), $2.93(1 \mathrm{H}$, $\mathrm{CH}), 2.13\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.81-1.23\left(6 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2}\right), 1.20 \mathrm{Ppm}\left(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}, \mathrm{CH}_{3} \mathrm{CH}\right) ;$ hrms $\mathrm{m} / \mathrm{z}$ $216.1523 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}, 216.1514$ ).

2(2'-KETOHEPTAN-6'-YL)-4-HYDROXY-5-METHYLBENZALDEHYDE [3a].-Isoparvifoline [2] (50 g ) in EtOAc ( 200 ml ) was treated with ozone at $-70^{\circ}$ until the characteristic blue color was obtained ( 12 h). The resultant solution was gradually added to a suspension of 35 g of powdered zinc and 300 ml of HOAc at $50 \%$. After 1 h of agitation, the mixture was filtered under reduced pressure. The resultant solution was neutralized with $10 \% \mathrm{NaHCO}_{3}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$, washed with $\mathrm{H}_{2} \mathrm{O}$, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated to dryness to obtain a sticky oil that was purified by chromatography over $\mathrm{SiO}_{2}$. Elution with $\mathrm{CHCl}_{3}-\mathrm{Me}_{2} \mathrm{CO}(9.5: 0.5)$, gave $48 \mathrm{~g}(96 \%)$ of the aldehyde 3 a as a colorless oil: ir $3400(\mathrm{OH}), 1710$ ( $\mathrm{C}=\mathrm{O}$ ketone), $1680 \mathrm{~cm}^{-1}\left(\mathrm{C}=\mathrm{O}\right.$ aldehyde); ${ }^{1} \mathrm{H} \mathrm{nmr} 9.93(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.45$ and $6.75(1 \mathrm{H}$ each, s , $\mathrm{ArH}), 8.51(1 \mathrm{H} \mathrm{br}, \mathrm{OH}), 3.76(1 \mathrm{H}, \mathrm{m}, J=7 \mathrm{~Hz}, \mathrm{CH}), 2.4\left(2 \mathrm{H} \mathrm{br}, \mathrm{CH}_{2} \mathrm{CO}\right), 2.23$ and $2.10(3 \mathrm{H}$ each, s , $7-\mathrm{CH}_{3}$ and $\left.13-\mathrm{CH}_{3}\right), 1.50\left(4 \mathrm{H}, \mathrm{br},-\mathrm{CH}_{2} \mathrm{CH}_{2}-\right), 1.13 \mathrm{ppm}\left(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}, \mathrm{CH}_{3} \mathrm{CH}\right)$; hrms $m / z$ $248.1431 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{3}, 248.1412$ ).

2(2'-KETOHEPTAN-6'-YL)-2-METHYL-1,4-HYDROQUINONE [4a].-To a solution containing 2.48 g of 3 a in 10 ml of IN NaOH was added at room temperature 12 ml of $3 \% \mathrm{H}_{2} \mathrm{O}_{2}$; the solution was kept in the dark at $40^{\circ}$ during $15 \mathrm{~h}(16)$. The mixture was neutralized with HOAc and extracted with $\mathrm{Et}_{2} \mathrm{O}$, giving after evaporation the hydroquinone $\mathbf{4 a}(2.3 \mathrm{~g}, 98 \%)$; ir $3400(\mathrm{OH})$ and $1710 \mathrm{~cm}^{-1}$ ( $\mathrm{C}=\mathrm{O}$ ketone); ${ }^{1} \mathrm{H} \mathrm{nmr}$ $6.56(2 \mathrm{H}$, apparent $\mathrm{s}, \mathrm{ArH}), 5.36\left(2 \mathrm{H}, \mathrm{br}, \mathrm{D}_{2} \mathrm{O}\right.$-exchangeable, ArOH$), 3.02(1 \mathrm{H}, \mathrm{m}, J=7 \mathrm{~Hz}, \mathrm{CH})$, $2.41\left(2 \mathrm{H}, \mathrm{brs}, 11-\mathrm{CH}_{2}\right), 2.13\left(6 \mathrm{H}, \mathrm{s}, 7-\right.$ and $\left.13-\mathrm{CH}_{3}\right), 1.46\left(4 \mathrm{H}, \mathrm{m},-\mathrm{CH}_{2} \mathrm{CH}_{2}-\right), 1.11 \mathrm{ppm}(3 \mathrm{H}, \mathrm{d}$, $\left.J=7 \mathrm{~Hz}, \mathrm{CH}_{3} \mathrm{CH}\right)$; hrms $m / z 236.1431 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{3}, 236.1412$ ).
(-)-CURCUHYDROQUINONE [5b].-A solution of phenol $\mathbf{4 a}(0.944 \mathrm{~g}, 4 \mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(50$ ml ) was added dropwise under anhydrous conditions to an ethereal solution of $\mathrm{CH}_{3} \mathrm{MgI}(2.33 \mathrm{~g}, 14 \mathrm{mmol})$. The mixture was agitated with warming to reflux during 3 h (17), hydrolyzed with $10 \% \mathrm{HCl}$, extracted twice with $\mathrm{Et}_{2} \mathrm{O}$, and evaporated to dryness. The crude product of the reaction was dissolved in 50 ml of $\mathrm{C}_{6} \mathrm{H}_{6}$ and treated with a catalytic quantity of $\mathrm{I}_{2}$. After heating at reflux for 0.5 h , the solution was washed $\left(\mathrm{H}_{2} \mathrm{O}\right)$ and evaporated to yield curcuhydroquinone $[\mathbf{5 b}](840 \mathrm{mg}, 90 \%)$ as an oil, $[\alpha]^{25} \mathrm{D}-36^{\circ}(62.3$, $\mathrm{CHCl}_{3}$ ). Spectroscopic properties (uv, ir, and ${ }^{1} \mathrm{H} n \mathrm{nmr}$ ) were identical to those reported ( 11 ). Curcuhydroquinone [5b] in $\mathrm{Me}_{2} \mathrm{CO}$ was treated with an excess of Jones reagent in the cold. After extraction with $\mathrm{Et}_{2} \mathrm{O}$, curcuquinone $[\mathbf{6 a}]$ (11) was obtained in quantitative yield.

Hydroxyperezone [6d]. - A mixture of $17 \% \mathrm{H}_{2} \mathrm{O}_{2}(2 \mathrm{ml})$ and $25 \% \mathrm{NaOH}(2 \mathrm{ml})$ was added to 200 mg of curcuhydroquinone [ $\mathbf{5 b}$ ]. The reaction mixture was stirred at room temperature overnight ( 18 ). After acidification with $10 \% \mathrm{HCl}$, extraction with EtOAc , drying $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and evaporation to dryness, the resulting orange-red plates, $\mathrm{mp} 121-123^{\circ}(200 \mathrm{mg}, 94 \%$ ), were characterized as hydroxyperezone [ $\mathbf{6 d}]$ by comparison with an authentic sample (10).

Xanthorrhizol [5a].-The aldehyde $\mathbf{3 a}$ ( 500 mg ) was dissolved in $\mathrm{C}_{6} \mathrm{H}_{6}\left(25 \mathrm{ml}\right.$ ) under $\mathrm{N}_{2}$. Chlorotris (triphenylphosphine) rhodium ( 21,22 ) ( 620 mg ) was added, and the solution warmed at $50^{\circ}$ with stirring during 3 h . As the red color vanished from the rhodium complex, a solid light yellow precipitate was formed that was removed by filtration under reduced pressure. The filtrate was evaporated to dryness to give a yellow oil which was chromatographed on $\mathrm{SiO}_{2}$. Elution with $\mathrm{CHCl}_{3}$ afforded 400 mg of $5-$ (2'-ketoheptan- $6^{\prime}$-yl)-2-methylphenol; ir $3400(\mathrm{OH})$ and $1710 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{O}) ;{ }^{1} \mathrm{H}$-nmr signals in the aromatic region were observed for three protons at $7.10,6.70$ (sharp and broad doublets, respectively, $J=8$ Hz ), and $6.50 \mathrm{ppm}(\mathrm{br}$ s) together with the signals previously described for its side chain; hrms $\mathrm{m} / \mathrm{z}$ $220.1458 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{2}, 220.1463$ ).

A solution of 5 -(2'-ketoheptan- $6^{\prime}$-yl)-2-methylphenol ( 350 mg ) in $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{ml})$ was treated with 2.2 equiv of $\mathrm{CH}_{3} \mathrm{MgI}$ and dehydrated as previously described to yield xanthorrhizol [5a] ( $260 \mathrm{mg}, 75 \%$ ). The physical and spectroscopic constants of the product were the same as those reported earlier (12).

IsOperezone [6b].-A solution of 1 g of $\mathbf{3 a}$ in 20 ml of $\mathrm{Me}_{2} \mathrm{CO}$ was treated with 1 ml of $\mathrm{Me}_{2} \mathrm{SO}_{4}$ and 2 g of $\mathrm{K}_{2} \mathrm{CO}_{3}$ and heated at $40^{\circ}$ for 1 h . The solution was filtered, concentrated, redissolved in EtOAc, washed with $\mathrm{H}_{2} \mathrm{O}$, and evaporated to yield 1 g of $\mathbf{3 b}$ as a colorless oil; ir $1700(\mathrm{C}=\mathrm{O}$ ketone), $1680(\mathrm{C}=\mathrm{O}$, aldehyde), $1250 \mathrm{~cm}^{-1}$ (aromatic ether); ${ }^{1} \mathrm{H} \mathrm{nmr} 9.93(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.40$ and $6.80(1 \mathrm{H}$ each, s, ArH), $3.99\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.71(1 \mathrm{H}, \mathrm{m}, J=7 \mathrm{~Hz}, \mathrm{CH}), 2.33\left(2 \mathrm{H}\right.$, br s, $\left.11-\mathrm{CH}_{2}\right), 1.20 \mathrm{ppm}(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}$, $\mathrm{CH}_{3} \mathrm{CH}$ ); hrms $m / z 262.1583 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{3}, 262.1569$ ).

The methoxyaldehyde $\mathbf{3 b}$ ( 500 mg ) dissolved in 2 ml of a solution obtained by mixing 1 ml of $32 \%$ $\mathrm{H}_{2} \mathrm{O}_{2}$ with 1 ml of $t-\mathrm{BuOH}$ was warmed at $50-60^{\circ}$ with a catalytic quantity of $\mathrm{SeO}_{2}(23)$ during 1 h . The addition of 10 ml of $\mathrm{H}_{2} \mathrm{O}$ permitted ethereal extraction of the reaction product. The organic layers were evaporated and chromatographed over Si gel, eluting with $\mathrm{CHCl}_{3}$, to give 300 mg of methoxyphenol $\mathbf{4 b}$ and 180 mg of the correspondent formate. The compound $\mathbf{4 b}$ gave absorptions in the ir at $3400(\mathrm{OH})$ and $1700 \mathrm{~cm}^{-1}\left(\mathrm{C}=\mathrm{O}\right.$ ketone); ${ }^{1} \mathrm{H} \mathrm{nmr} 7.34\left(1 \mathrm{H}, \mathrm{brs}, \mathrm{D}_{2} \mathrm{O}\right.$ exchange), $6.41(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 3.75(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3} \mathrm{O}\right), 2.86(1 \mathrm{H}, \mathrm{m}, J=7 \mathrm{~Hz}, \mathrm{CH}), 2.30\left(2 \mathrm{H}, \mathrm{brs}, 11-\mathrm{CH}_{2}\right), 2.03\left(6 \mathrm{H}, \mathrm{s}, \mathrm{A} C \mathrm{CH}_{3}, 13-\mathrm{CH}_{3}\right), 1.46(4 \mathrm{H}$, $\mathrm{m},-\mathrm{CH}_{2} \mathrm{CH}_{2^{-}}$), $1.16 \mathrm{ppm}\left(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}, \mathrm{CH}_{3}-\mathrm{CH}\right)$; hrms $\mathrm{m} / \mathrm{z} 250.1591 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{3}$, 250.1569). The formate gave ir absorptions at 1760 and $1700 \mathrm{~cm}^{-1}\left(\mathrm{C}=\mathrm{O}\right.$ formate and ketone); ${ }^{1} \mathrm{H} \mathrm{nmr}$ $8.28\left(1 \mathrm{H}\right.$, sharp s, $\mathrm{D}_{2} \mathrm{O}$ no exchange), 7.66 and $7.00(1 \mathrm{H}$ each, $\mathrm{s}, \mathrm{ArH}), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{;} \mathrm{O}\right)$, and the signals previously described for its side chain.

The formate in $\mathrm{EtOH}(10 \mathrm{ml})$ was treated with $10 \% \mathrm{~K}_{2} \mathrm{CO}_{3}$ at $50^{\circ}$ for 15 min and neutralized ( $10 \%$ $\mathrm{HCl})$. Extraction with $\mathrm{Et}_{2} \mathrm{O}$ yielded the methoxyphenol $\mathbf{4 b}$.

The compound $\mathbf{4 b}$ ( 400 mg ) in $\mathrm{Et}_{2} \mathrm{O}$ was treated with 2.2 equiv of $\mathrm{CH}_{3} \mathrm{MgI}$ and dehydrated (catalytic $\mathrm{I}_{2}$ ). Work-up as described above yielded curcuhydroquinone 4 -methyl ether [ $\mathbf{5 c}$ ] ( $375 \mathrm{mg}, 94 \%$ ); ir $3450 \mathrm{~cm}^{-1}(\mathrm{OH}),{ }^{1} \mathrm{H} \mathrm{nmr} 6.31\left(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}, \mathrm{D}_{2} \mathrm{O}\right.$ exchange), $5.01(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}=), 3.71(3 \mathrm{H}, \mathrm{s}, \mathrm{MeO})$, $2.80(1 \mathrm{H}, \mathrm{m}, J=7 \mathrm{~Hz}, \mathrm{CH}), 2.07\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.63$ and $1.46\left(2 \times 3 \mathrm{H}\right.$ br singlets, $\left.\mathrm{C}=\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $1.10\left(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}, \mathrm{CH}_{3} \mathrm{CH}\right.$ ) ; hrms $m / z 248.1752 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{16} \mathrm{H}_{2+} \mathrm{O}_{2}, 248.1776$ ).

A solution containing $375 \mathrm{mg}(1.6 \mathrm{mmol})$ of curcuhydroquinone 4 -methyl ether $\{5 \mathrm{c}]$ in MeCN ( 15 ml ) was reacted with catalytic quantities of $\mathrm{Cu}_{2} \mathrm{Cl}_{2}$ and $\mathrm{Cu}^{\circ}$ powder ( 10 mg each ) $(24,25$ ). The reaction was
stirred at room temperature in an $\mathrm{O}_{2}$ atmosphere for 4 h . It was then acidified with $10 \% \mathrm{HCl}$ and extracted three times with $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{ml})$. The combined extracts were dried and concentrated to give a yellow oil [ 5 d ] ( $350 \mathrm{mg}, 87 \%$ ) that was used without purification. Demethylation (26) of 5 d was carried out with $\mathrm{AgO}(380 \mathrm{mg}, 3 \mathrm{mmol})$ in $\mathrm{Me}_{2} \mathrm{CO}(15 \mathrm{ml})$ and $6 \mathrm{~N} \mathrm{HNO}_{3}(0.7 \mathrm{ml})$. The reaction was kept at $50^{\circ}$ during $10-15 \mathrm{~min}$ (until AgO was consumed) and then quenched by addition of 10 ml of $\mathrm{H}_{2} \mathrm{O}$ and 10 ml of $\mathrm{CHCl}_{3}$. The aqueous phase was extracted three times with $\mathrm{CHCl}_{3}$. The organic layers were combined, dried over $\mathrm{MgSO}_{4}$, and concentrated to give $270 \mathrm{mg}(82 \%)$ of isoperezone [ 6 b ], yellow plates, $\mathrm{mp} 97-98^{\circ}$; ir $3250\left(\mathrm{OH}\right.$ ) and $1670 \mathrm{~cm}^{-1}$ (quinoid ring); ${ }^{1} \mathrm{H} \mathrm{nmr}$ similar to perezone [ $\left.\mathbf{6 c}\right]$ except the signals corresponding to the quinoid proton ( $1 \mathrm{H}, \mathrm{s}, 5.46$ ) and the quinoid $\mathrm{Me}(3 \mathrm{H}, \mathrm{s}, 2.06 \mathrm{ppm})$. Acetylation of $\mathbf{6 b}$ with $\mathrm{Ac}_{2} \mathrm{O}-\mathrm{NaOAc}$ by the conventional method gave 2 -acetoxy- 5 -desoxyperezone (isoperezone acetate) (9).

Perezone [ $\mathbf{6 c}$ ].-To a solution of aldehyde $\mathbf{3 a}$ ( 500 mg ) in $\mathbf{M e C N}$ under an $\mathrm{O}_{2}$ atmosphere was added catalytic $\mathrm{Cu}_{2} \mathrm{Cl}_{2}$ and $\mathrm{Cu}^{\circ}$ powder ( 15 mg each). After 12 h the product was worked up as described above, yielding $2-\left(2^{\prime}\right.$-ketoheptan- $6^{\prime}$-yl)-3,4-dihydroxy-5-methylbenzaldehyde ( 480 mg , $90 \%$ ); ir 3450 $(\mathrm{OH}), 1680,1710 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{O}) ;{ }^{1} \mathrm{H} \mathrm{nmr} 9.98(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 8.48\left(2 \mathrm{H}, \mathrm{brs}, \mathrm{D}_{2} \mathrm{O}\right.$ exchange $), 7.51(1 \mathrm{H}$, $\mathrm{s}, \mathrm{ArH})$ besides the typical signals of its side chain; hrms $m / z 264.1379 \mathrm{M}^{+}$(calcd for $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{4}$, 264.1361).

A solution of 2-(2'-ketoheptan-6'-yl)-3,4-dihydroxy-5-methylbenzaldehyde ( 400 mg ) with 5 ml of a mixture of $3 \% \mathrm{H}_{2} \mathrm{O}_{2}$ and 1 N NaOH (1:1) was stirred at $40^{\circ}$ for 18 h in the dark. The reaction mixture was worked up as described above. The corresponding phenol (hydroxyhydroquinone) was readily oxidized but was shown not to contain an aldehyde group (ir, ${ }^{1} \mathrm{H} \mathrm{nmr}$ ). It was dissolved in anhydrous $\mathrm{Et}_{2} \mathrm{O}$ and was treated with 5 equiv of $\mathrm{CH}_{3} \mathrm{MgI}$. Work-up by the procedure described above gave an oily material which with air or Jones reagent gave yellow plates, mp $98^{\circ}$, characterized as perezone $[\mathbf{6 c}](8)(73 \%)$.
