# A SHORT SYNTHESIS OF (+)-COLARTIN AND (+)-ARBUSCULIN A FROM (-)-SANTONIN 

Gonzalo Blay, Luz Cardona, Begoña Garcia, and Jose R. Pedro*<br>Department of Organic Chemistry, Faculty of Cbemistry, Valencia University, 46100-Burjassot, Valencia, Spain

> ABSTRACT.-Colartin $[8]$ and arbusculin A $[9]$ have been synthesized from $\alpha$-santonin $[1]$ in $18.2 \%$ (8 steps) and $12.9 \%$ (10 steps) overall yields, respectively.

Sesquiterpene lactones make up a group of natural compounds, widely present in plants (1), which exhibit a broad spectrum of biological activities (2). Colartin [8] and its 11,13-dehydroderivative, arbusculin A [9], are two members of the eudesmane class of sesquiterpene lactones, which show significant cell growth inhibitory activity against murine lymphocytic leukemia and plant growth regulating activity (3).

Two syntheses of both natural products 8 and 9 starting from $\alpha$-santonin [1] have been reported ( 3,4 ); however, these syntheses are rather lengthy. Therefore, we have developed a shorter synthetic pathway for 8 and 9 from 1, involving the epoxide 3 as a key intermediate.

## RESULTS AND DISCUSSION

The starting material $\mathbf{1}$ was converted into alkene $\mathbf{2}$ in a five-step sequence described earlier (5). In a preliminary approach we attempted a direct Markownikoff hydration of the 3,4 double bond (6). However, all experimental results were unsuccessful, and we then proceeded to introduce the desired functionality at C-4 by indirect hydration through the 3,4-epoxide 3 by opening of the oxirane ring with a selenide anion followed by deselenization with Raney nickel (7). This epoxide 3 was prepared by reaction of alkene $\mathbf{2}$ with $m$-CPBA or with in situ generated dimethyldioxirane (8) in $90 \%$ and $99 \%$ yield, respectively. However, experiments to open the oxirane ring with PhSeNa / $\mathrm{Ti}(\mathrm{iPrO})_{4} / \mathrm{DMF}$ (9) and other similar reagents (10) were unsuccessful, as they gave primarily unreacted starting material along with a poor yield of allylic alcohol 4.

Other attempts to open the oxirane ring with a variety of reagents, to give a 4 hydroxyfunctionalized product, were also unsuccessful. Thus, for example, with $\mathrm{I}_{2} / \mathrm{Ph}_{3} \mathrm{P}$ (11) or $\mathrm{CCl}_{4} / \mathrm{Ph}_{3} \mathrm{P}$ (12), the allylic alcohol 4 was obtained in $76 \%$ yield, while with $\mathrm{PhSH} / \mathrm{LiClO}_{4} / \mathrm{MeCN}$ (13) or $\mathrm{ZnI}_{2} / \mathrm{Et}_{2} \mathrm{O}$ (14) mixtures with variable ratios of starting material 3, allylic alcohol 4, and rearranged aldehyde 5 were obtained. The 11,13dehydroderivative of 5 has recently been described as a natural product (15).

Attempts were also made to open the oxirane ring by selective reduction with $\mathrm{NaBH}_{4} / t-\mathrm{BuOH} / \mathrm{MeOH}$ (16) or DIBALH/toluene (17). In both cases the reactivity of the lactone was higher than that of the epoxy group, so that with the former reagent the epoxy-diol 6 was obtained in $76 \%$ yield. This product afforded the triol $7(76 \%$ yield) upon reduction with $\mathrm{LiAlH}_{4}$. In a last approach we carried out the simultaneous reduction of both functional groups with $\mathrm{LiAlH}_{4} / \mathrm{THF}$ to give triol $7(74 \%)(18)$, which was reoxidized with $\mathrm{CrO}_{3}-\mathrm{H}_{2} \mathrm{SO}_{4} / \mathrm{Me}_{2} \mathrm{CO}$ (19) to give colartin [8] in $71 \%$ yield. Phenylselenylation of $\mathbf{8}$ by Grieco's method (20) followed by oxidative elimination then gave arbusculin A [9] in $71 \%$ yield (Scheme 1).

EXPERIMENTAL

General experimental procedures.-All melting points are uncorrected. Tlc was carried out on Merck 0.25 mm Si gel HF 254 analytical aluminum plates. Cc separations were performed on Merck Si gel

To a solution of $2(52 \mathrm{mg}, 0.216 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{ml})$ were added $\mathrm{Me}_{2} \mathrm{CO}(3 \mathrm{ml})$, $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{ml})$, $18-\mathrm{Crown}-6(5 \mathrm{mg})$, and $\mathrm{NaHCO}_{3}(300 \mathrm{mg}, 3.57 \mathrm{mmol})$. The mixture was vigorously stirred, and 1 ml of 0.29 MOxone ( 0.58 mmol of $\mathrm{KHSO}_{5}$ ) in $\mathrm{H}_{2} \mathrm{O}$ was added dropwise at $0^{\circ}$. Stirring was continued for 1 h , after which time saturated aqueous $\mathrm{NaHCO}_{3}$ was added. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic layers were washed with $10 \%$ aqueous $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and saturated aqueous $\mathrm{NaHCO}_{3}$, and then dried. After evaporation of the solvent under reduced pressure, the residue was chromatographed to give 3 ( $55.2 \mathrm{mg}, 99 \%$ ) with the above-described features.

The reaction was quenched by adding 0.5 M aqueous HCl and extracted with EtOAc. The combined extracts were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, and concentrated to give a yellow oil, which, after chromatography eluting with EtOAc-hexane (2:8), afforded the corresponding phenylselenolactone ( 48.9 $\mathrm{mg}, 80 \%$ ): $\mathrm{mp} 162-166^{\circ}\left(\mathrm{Et}_{2} \mathrm{O} /\right.$ hexane $)$; $\mathrm{ir}(\mathrm{KBr}) 3560,1770 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \mathrm{nmr} \delta 0.96(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-14), 1.24(3 \mathrm{H}$, $\mathrm{s}, \mathrm{H}-13), 1.53(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-15), 1.66(1 \mathrm{H}, \mathrm{d}, J=11.5, \mathrm{H}-5), 2.99(1 \mathrm{H}, \mathrm{s},-\mathrm{OH}), 4.37(1 \mathrm{H}, \mathrm{dd}, J=9.9,11.5$, $\mathrm{H}-6), 7.2-7.5(3 \mathrm{H}, \mathrm{m}$, aromatic), $7.64(2 \mathrm{H}, \mathrm{dd}, J=1.3,8.0$, aromatic).

A solution of this phenylselenolactone ( $48 \mathrm{mg}, 0.118 \mathrm{mmol}$ ) in $\mathrm{THF}(0.75 \mathrm{ml}$ ) containing HOAC ( 17 $\mu \mathrm{l}$ ) was treated at $0^{\circ}$ with $30 \% \mathrm{H}_{2} \mathrm{O}_{2}(0.1 \mathrm{ml})$ for 1 h . The reaction mixture was diluted in EtOAc, washed with $10 \%$ aqueous $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and saturated aqueous NaCl , and dried $\left(\mathrm{MgSO}_{4}\right)$. Usual workup and chromatography eluting with EtOAc-hexane (3:7) yielded arbusculin A [9] ( $26.3 \mathrm{mg}, 89 \%$ ): mp 75-77 ${ }^{\circ}$ ( $\mathrm{Er}_{2} \mathrm{O} /$ hexane $)\left[\mathrm{lit}\right.$.
