#### Abstract

The aerial parts of Santolina viscosa afforded the new longipinene derivatives, methyl longipin-9-en-15-oate [1], methyl 14-hydroxylongipin-9-en-15-oate [2], methyl 12-hydroxylongipin- 9 -en-15-oate [3], methyl 14-methoxylongipin-9-en-15-oate [4], and methyl 12 -methoxylongipin-9-en-15-oate [5]. Their structures were established by 2D nmr experiments and chemical correlations. The conformational analysis of the seven-membered ring was achieved through the use of nmr techniques and molecular mechanics calculations. Furthermore, a single-crystal X-ray diffraction study of the $p$-bromobenzoyl derivative 9 established the absolute stereochemistry of these compounds.

The genus Santolina has been reported to possess compounds with diverse biological and pharmacological properties (1,2). As a continuation of our previous work on aromatic and medicinal plants endemic to Southern Spain (3), this paper describes the isolation and structural elucidation of five longipinene derivatives [1-5] found in the aerial parts of Santolina viscosa Lag. (Compositae). So far, stereochemical and conformational studies of longipinene derivatives have been described only in compounds with substituents at the seven-membered ring (4). We describe herein a conformational study of the new longipinene derivatives using nmr techniques and molecular mechanics calculations.

## RESULTS AND DISCUSSION

Compounds $\mathbf{1}-\mathbf{5}$, previously esterified with $\mathrm{CH}_{2} \mathrm{~N}_{2}$, were isolated from the hexane extract of the aerial parts of $S$. viscosa. Allylic oxidation of 1 with $\mathrm{SeO}_{2}$ gave $\mathbf{6}$, whose molecular formula was established by its mass ( $[\mathrm{M}]^{+}$at $m / z 262$ ) and ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{nmr}$ spectra. Analysis of the ${ }^{13} \mathrm{C}-\mathrm{nmr}$ spectrum of 6 indicated it was the methyl ester of a tricyclic sesquiterpene. The ir bands at 2714 and $1677 \mathrm{~cm}^{-1}$, together with the nmr signals at $\delta 9.38$ and $6.67 \mathrm{ppm}\left({ }^{1} \mathrm{H} \mathrm{nmr}\right)$ and $190.17 \mathrm{ppm}\left({ }^{13} \mathrm{C} \mathrm{nmr}\right)$, revealed the presence of an $\alpha, \beta$-unsaturated aldehyde. The methyl ester was shown in its ir (1727 $\mathrm{cm}^{-1}$ ), ${ }^{1} \mathrm{H}-\mathrm{nmr}$ (methoxyl group at $\delta 3.57, \mathrm{~s}$ ) and ${ }^{13} \mathrm{C}-\mathrm{nmr}$ (carbonyl group at $\delta 177.69$ ) spectra. The correlations observed in HETCOR and COSY nmr measurements allowed the determination of connectivities I and II in the molecule of compound 6 (Figure 1).

Figure 1. Connectivities Determined by HETCOR and COSY Nmr Measurements for 6.

Assignment of the methyl 12-oxo-longipin-9-en-15-oate structure to 6 was achieved on the basis of the long-range correlations observed in the ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ COLOC nmr experiment (Figure 2).

Figure 2. Long-Range Correlations Observed for 6 in the ${ }^{1} \mathrm{H}_{-}{ }^{13} \mathrm{C}$ COLOC Experiment.

Natural compound 1 showed a methyl group attached to a trisubstituted double bond ( ${ }^{1} \mathrm{H} \mathrm{nmr}, \mathrm{q}, \delta 1.68 \mathrm{ppm} ;{ }^{13} \mathrm{C}, \delta 23.01$ ) instead of the aldehyde group of 6 . The spectroscopic data of 2 were very similar to those of $\mathbf{1}$, showing in its ms the presence of an additional oxygen, $[\mathrm{M}]^{+}$at $m / z 264\left(\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{O}_{3}\right)$, which was attributed to the presence of a $-\mathrm{CH}_{2} \mathrm{OH}$ group attached to a quaternary carbon $\left({ }^{1} \mathrm{H}, \mathrm{d}, \delta 3.53 ;{ }^{13} \mathrm{C}, \delta\right.$ 66.65). The chemical shift variations experienced by the signals corresponding to $\mathrm{C}-6$, C-7, and C-5 with respect to the values of $\mathbf{1}$ (Tables 1 and 2 ), were those theoretically predictable according to the $\beta$ and $\gamma$-effects produced by the presence of a hydroxyl at $\mathrm{C}-14$. This permitted the location of the $\mathrm{CH}_{2} \mathrm{OH}$ at $\mathrm{C}-6$. The presence of a hydroxyl group at C-14 was confirmed by oxidation of 2 with pyridinium dichromate (PDC), leading to the formation of the monomalonyl ester, 7 , which decarboxylated in refluxed toluene to give a mixture of diastereomers, 8. On the other hand, the chemical correlation of $\mathbf{2}$ with $\mathbf{1}$ was achieved by oxidation of $\mathbf{2}$ with PDC/DMF and subsequent reduction of the resulting aldehyde following the Huang-Minlon procedure (5).

The spectroscopic features of $\mathbf{3}$ resembled those of $\mathbf{2}$. The molecular ion appeared at $\mathrm{m} / \mathrm{z} 262$ in both compounds, indicating that they were isomers. The hydroxyl group in 3 was located at $\mathrm{C}-12$ on the grounds of the chemical shift and multiplicity of the signal corresponding to $\mathrm{H}-12(84.0 \mathrm{ppm}, \mathrm{q}, J=1.7 \mathrm{~Hz})$ in the ${ }^{1} \mathrm{H}-\mathrm{nmr}$ spectrum, and the shielding experienced by $\mathrm{C}-8$ ( $\delta 42.7 \mathrm{ppm}$ ) with regard to the chemical shift of $\mathrm{C}-8$ in compound 1 ( $\delta 47.2 \mathrm{ppm}$ ).

Compounds 4 and 5 were the corresponding methyl ethers of alcohols 2 and 3, respectively. Their structures were confirmed by methylation of $\mathbf{2}$ and $\mathbf{3}$, respectively, with MeI in the presence of NaH .

Because the 4 - and 6-membered bicyclic system is rigid for longipinenes, each

structure can have the four A-D main conformations of the cycloheptane ring (Figure 3). Conformations C and D have a close resemblance to the classical, chair and boat, respectively; yet A and B do not correspond to any of the four classical conformers, but are an intermediate state between chair and twist-chair, which could be called "chair, twist-chair transition conformation A" and "chair, twist-chair transition conformation B", respectively. Molecular mechanics calculations were carried out for structures 2, 6, $\mathbf{8 , 9}$, and longipinene 10. For compounds 2 and $\mathbf{1 0}$, calculations were performed on the four conformations. We observed that A and B were the most stable ones, showing similar stability (Table 3). As can be seen in this table, the contribution to the total population of $C$ and $D$ conformers was negligible due to their high energy values (relative populations less than $10^{-3}$ ). Accordingly, these two conformations were not considered in the study for the rest of the structures.

From the different $A$ and $B$ conformations obtained for each compound by molecular mechanics, theoretical coupling constants were obtained using the 3JHH2 program (see computational aspects in Experimental). When we compared these data with the coupling constants calculated for conformers A and B (Table 4) with the experimental data measured in $\mathrm{CDCl}_{3}$ solution, we observed a remarkable resemblance between the average and the experimental data. This together with the energy figures obtained for the different conformations (Table 3) led us to conclude that these molecules present a rapid balance between A and B conformations.

The existence of only $A$ and $B$ conformations in equilibrium for these natural products facilitated the assignment of the relative configuration at C-6. Thus, in compound 6, the nOe observed between $\mathrm{H}-1$ and $\mathrm{H}-14$ could only be explained if the molecule adopted the dispositions depicted in Figure 4.

A view of the molecular structure of the $p$-bromobenzoate 9 , as determined by X ray diffraction, is shown in Figure 5. Bond distances and angles within the molecule were

Figure 5. Perspective View of the Molecular Structure of 9.
those expected (6) in accordance with the $\mathrm{sp}^{2}$ or $\mathrm{sp}^{3}$ nature of the atoms involved and the geometric constraints imposed by the rings. The dispositions of the substituents at C 6 is indicated by the torsion angles: $\mathrm{C}-2^{\prime \prime}-\mathrm{O}-3-\mathrm{C}-14-\mathrm{C}-7=169.4^{\circ}, \mathrm{O}-3-\mathrm{C}-14-\mathrm{C}-6-\mathrm{C}-$ $5=64.6^{\circ}, \mathrm{O}-2-\mathrm{C}-15-\mathrm{C}-6-\mathrm{C}-5=-1.5^{\circ}$.

The deviations of atoms $\mathrm{C}-4$ and $\mathrm{C}-5$ from the $\mathrm{C}-2-\mathrm{C}-3-\mathrm{C}-6-\mathrm{C}-7$ plane (see Table 5) allowed us to determine as type $B$ the conformation of the seven-membered ring in 9. The same conformation was found in the crystal structure of three other longipinene derivatives (7-9), whereas type A conformation was found in only one case (10). The differences between both conformations are also evident from the torsion angles in the seven-membered ring, also included in Table 5. ${ }^{1}$

## EXPERIMENTAL

Generalexperimental procedures.-Mps were measured with a Reichert Kofler microscope and are uncorrected. Optical rotations were measured on a Perkin-Elmer Model 141 polarimeter. Ir spectra were obtained on a Perkin-Elmer 983G instrument. Eims were determined on a Hewlett-Packard 5988A mass spectrometer. Nmr ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, NOEDIF and 2D experiments) were recorded on a Bruker AM 300 spectrometer using TMS as internal standard. Cc was carried out using Si gel Merck 60 ( $70-230$ mesh) and eluting with mixtures of hexane/ $\mathrm{Et}_{2} \mathrm{O} / \mathrm{EtOAc}$ of increasing polarity. Anal. tle was performed on layers of Si gel Merck 60 G of 0.25 mm thickness, using a $7 \%$ phosphomolybdic acid solution in EtOH to visualize the spots.

${ }^{2} \phi_{1,2}$ is the abreviation for the torsion angle C-7-C-1-C-2-C-3. Analogous definitions for the torsion angles in the $\mathrm{C}-1-\mathrm{C}-2-\mathrm{C}-3-\mathrm{C}-4-\mathrm{C}-5-\mathrm{C}-6-\mathrm{C}-7$ ring.
${ }^{5}$ Distances of $\mathrm{C}-4$ and $\mathrm{C}-5$ from the least-square $\mathrm{C}-2-\mathrm{C}-3-\mathrm{C}-6-\mathrm{C}-7$ plane. Positive values indicate deviations toward $C-1$. Negative values indicate deviations toward C-8.

Plant material.-Santolina viscosa Lag. (Compositae) was collected in Las Yeserías (Almería, Spain) and was identified by Professor J. Molero, Departamento de Biología Vegetal, Universidad de Granada. A voucher specimen is available for inspection at the Herbarium of the Facultad de Farmacia, Universidad de Granada.

EXTRACTION AND ISOLATION.-The air-dried material ( 7.9 kg ) was extracted in a Soxhlet apparatus, resulting in 510 g of extract. A 60 g portion was defatted, dissolved in $\mathrm{Et}_{2} \mathrm{O}$, and extracted with a 1 N NaOH solution to yield 35 g of a neutral fraction and 10.5 g of an acid one. The latter was treated with $\mathrm{CH}_{2} \mathrm{~N}_{2}$ to obtain the mixture of the methyl esters of the corresponding acids. This mixture was subjected to cc over Si gel using mixtures of hexane/ $\mathrm{Et}_{2} \mathrm{O}$ of increasing polarity as eluents. Six main fractions were collected (AF). The less polar fraction contained 1 [hexane- $\left.\mathrm{Et}_{2} \mathrm{O}(9: 1)\right]$. Fraction B yielded 2 [hexane- $\left.\mathrm{Et}_{2} \mathrm{O}(8: 2)\right]$. The third fraction [hexane- $\left.\mathrm{Et}_{2} \mathrm{O}(7: 3)\right]$ was rechromatographed with hexane and increasing amounts of $\mathrm{Et}_{2} \mathrm{O}$ to give 3 [hexane- $\left.\mathrm{Et}_{2} \mathrm{O}(95: 5)\right]$. Fraction Dafforded $\boldsymbol{4}\left[\right.$ hexane $\left.-\mathrm{Et}_{2} \mathrm{O}(6: 4)\right]$. The following fraction, E , contained a mixture of 4 and 5 [hexane- $\left.\mathrm{Et}_{2} \mathrm{O}(6: 4)\right]$. Finally, F was pure 5 [hexane- $\left.\mathrm{Et}_{2} \mathrm{O}(1: 1)\right]$.

CONVERSION OF 2 to 1 .-A solution of $2(175 \mathrm{mg})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{ml})$ was stirred for 24 h with PDC ( 378 mg ) to obtain 75 mg of the corresponding aldehyde which was mixed with hydrazine hydrate ( 100 mg ), diethylene glycol ( 2 ml ), and $\mathrm{KOH}\left(285 \mathrm{mg}\right.$ ) and heated at $200^{\circ}$ for 2 h under $\mathrm{N}_{2}$. The usual work-up gave a crude product which, after treatment with $\mathrm{CH}_{2} \mathrm{~N}_{2}$, was subjected to cc to yield 15 mg of 1 .

CONVERSION of 2 то 9.-A solution of 274 mg of $N, N^{\prime}$-carbonyldiimidazole and 340 mg of $p$ bromobenzoic acid in THF ( 5 ml ) was stirred for 1 h under $\mathrm{N}_{2}$. Then 240 mg of $\mathbf{2} \mathrm{in} 2 \mathrm{ml}$ of THF were added dropwise. The reaction mixture was allowed to stand 24 h at room temperature. The THF solution was concentrated and, after addition of $\mathrm{H}_{2} \mathrm{O}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$. Cc of the crude product afforded $9(380 \mathrm{mg})$. Colorless crystals, mp 93-95 ; $[\alpha]^{25} \mathrm{D}+7.5^{\circ}\left(c=1.0, \mathrm{CHCl}_{3}\right.$ ); eims ( 70 eV ) m/z 448 (1), 446 (1), 388 (1), 386 (1), 301 (1), 145 (39), 299 (1), 263 (1), 246 (15), 214 (27), 185 (100), 183 (92), 119 (97), 91 (52); ir $\nu \max$ (film) 2923, 2838, 1726, 1590, 1482, 1434, 1397, 1374, 1269, 1213, 1192, 1174, 1152, 1115, $1102,1062,1012,984,915,848,802,756,682 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta 0.85(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-13), 1.47-1.76$ $(5 \mathrm{H}, \mathrm{m}, \mathrm{H}-3, \mathrm{H}-4, \mathrm{H}-5 \mathrm{a}), 1.68(3 \mathrm{H}, \mathrm{q}, J=1.9 \mathrm{~Hz}, \mathrm{H}-12), 3.69(3 \mathrm{H}, \mathrm{s},-\mathrm{OCOM}), 4.26(1 \mathrm{H}, \mathrm{d}, J=4.0 \mathrm{~Hz}$, $\mathrm{H}-14 \mathrm{a}), 4.32(1 \mathrm{H}, \mathrm{d}, J=4.0 \mathrm{~Hz}, \mathrm{H}-14 \mathrm{~b}), 5.19-5.22(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-10), 7.56\left(2 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}, \mathrm{H}-3^{\prime}, \mathrm{H}-\mathrm{s}^{\prime}\right)$, $7.82\left(2 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}, \mathrm{H}-2^{\prime}, \mathrm{H}-6^{\prime}\right) ;{ }^{13} \mathrm{C} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta 21.94(\mathrm{C}-4), 22.90(\mathrm{C}-12), 23.24(\mathrm{C}-13), 30.47$ (C-5), 33.97 (C-11), 40.04 (C-2), 40.20 (C-1), 40.32 (C-3), 46.86 (C-1), 50.12 (C-7), 50.65 (C-6), 51.91 (-COOMe), $68.88(\mathrm{C}-14), 117.36(\mathrm{C}-10), 128.22\left(\mathrm{C}-1^{\prime 2}\right), 128.86\left(\mathrm{C}-4^{\prime 2}\right), 131.13\left(\mathrm{C}-2^{\prime}, \mathrm{C}-6^{\prime}\right), 131.94(\mathrm{C}-$ $3^{\prime}, \mathrm{C}-5^{\prime}$ ) , $147.10(\mathrm{C}-9), 165.49$ (-CO-Ph-Br), 175.27 ( -COOMe ). ( ${ }^{2-b}$ Signal assignments with the same letter may be interchanged).

CONVERSION OF 2 TO 8a AND 8b.-Pyridinium dichromate ( 2.0 g ) was added to a solution of 2 ( 400 mg ) in DMF ( 5 ml ). The mixture was stirred for 12 h at room temperature. The usual work-up gave 300 mg of a product, which was refluxed in toluene for 50 h . After removing the toluene, the residue was redissolved in $\mathrm{Et}_{2} \mathrm{O}$ and extracted with $10 \% \mathrm{NaOH}$. Evaporation of the organic layer and cc of the product afforded a mixture of $\mathbf{8 a}$ and $\mathbf{8 b}(100 \mathrm{mg})$. Syrup; $[\alpha]^{25} \mathrm{D}+13.6^{\circ}\left(c=1.0, \mathrm{CHCl}_{3}\right.$ ); eims ( 70 eV ) m/z 234 (2), 221 (10), 207 (6), 173 (6), 147 (46), 119 ( 60 ), 105 (31), 91 (33), 73 (100); ir $v$ max (film) 2920, 2838, 1735, $1436,1373,1318,1260,1097,1032,804 \mathrm{~cm}^{-1} .8 \mathrm{a}:{ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta 0.86(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-13), 1.46-1.83(6 \mathrm{H}$, $\mathrm{m}, \mathrm{H}-3, \mathrm{H}-4, \mathrm{H}-5), 1.66(3 \mathrm{H}, \mathrm{q}, J=2.0 \mathrm{~Hz}, \mathrm{H}-12), 2.14-2.34(5 \mathrm{H}, \mathrm{m}, \mathrm{H}-1, \mathrm{H}-7, \mathrm{H}-8, \mathrm{H}-11), 2.59(1 \mathrm{H}$, ddd, $J=9.7,5.2$, and $2.5 \mathrm{~Hz}, \mathrm{H}-6), 3.63(3 \mathrm{H}, \mathrm{s},-\mathrm{COOMe}), 5.16-5.20(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-10) ;{ }^{13} \mathrm{C} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta$ 22.95 (C-12), 23.41 (C-13), 24.32 (C-4), 27.98 (C-5), 33.64 (C-11), 40.21 (C-3), $40.60(\mathrm{C}-2), 41.52$ (C1), $46.35\left(\mathrm{C}-6^{2}\right), 47.24\left(\mathrm{C}-7^{2}\right), 48.21\left(\mathrm{C}-1^{2}\right), 51.41(-\mathrm{COOM}), 117.66(\mathrm{C}-10), 147.16(\mathrm{C}-9), 176.71$ (-COOMe). 8b: ${ }^{1} \mathrm{H} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta 0.83(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-13), 1.46-1.83(6 \mathrm{H}, \mathrm{m}, \mathrm{H}-3, \mathrm{H}-4, \mathrm{H}-5), 1.66(3 \mathrm{H}, \mathrm{q}$, $J=2.0 \mathrm{~Hz}, \mathrm{H}-12), 2.03(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-8), 2.14-2.34(4 \mathrm{H}, \mathrm{m}, \mathrm{H}-1, \mathrm{H}-7, \mathrm{H}-11), 2.70(1 \mathrm{H}, \mathrm{ddd}, J=9.3,5.6$, and $2.7 \mathrm{~Hz}, \mathrm{H}-6), 3.61(3 \mathrm{H}, \mathrm{s},-\mathrm{COOMe}), 5.16-5.20(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-10) ;{ }^{13} \mathrm{C} \mathrm{nmr}\left(\mathrm{CDCl}_{3}\right) \delta 22.87(\mathrm{C}-12), 23.35$ (C-13), 24.12 (C-4), 27.98 (C-5), 33.59 (C-11), 40.35 (C-3), 40.56 (C-2), 40.66 (C-1), 46.45 (C-6 $), 47.89$ (C-7) , 48.12 (C-1 ${ }^{\mathrm{b}}$ ), 51.41 (-COOMe), 117.14 (C-10), 146.74 (C-9), 176.48 (-COOMe). ( ${ }^{\text {ab }}$ Signal assignments with the same letter may be interchanged).

Methylation of 2 and 3.-A solution of 160 mg of the alcohol 2 in 5 ml of THF was treated with MeI ( 0.25 ml ) followed by 40 mg of $\mathrm{NaH}(20 \%$ paraffin liquid). The mixture was stirred for 2 h at room temperature. The usual workup yielded a crude product which was purified by cc to give $\mathbf{4}(125 \mathrm{mg}$ ). Compound 3 was treated as 2 to give 5.

X-Ray diffraction analysis of compound 9.-Crystal data: $\mathrm{C}_{23} \mathrm{H}_{27} \mathrm{BrO}_{4}$, mol wt $=447.4$, triclinic, space group $P 1, a=6.669$ (2), $b=9.235$ (3), $c=10.462$ (4) $\AA, \alpha=67.05$ (1), $\beta=73.43$ (2), $\gamma=69.22$ (2) ${ }^{\circ}$ (from 20 random oriented reflections), $V=546.6$ (3) $\AA^{3}, Z=1, F(000)=232, D_{c}=1.359 \mathrm{~g} / \mathrm{cm}^{-3}, \mathrm{MoK} \alpha$ radiation $(\lambda=0.71069 \AA), \mu=18.83 \mathrm{~cm}^{-1}$. Crystal dimensions $0.28 \times 0.26 \times 0.46 \mathrm{~mm}$.

A total of 5817 reflections with $-10<h<10,-14<k<14,-2<1<16,2 \theta<70^{\circ}$ were recorded using a Siemens $\mathrm{R} 3 \mathrm{~m} / \mathrm{V}$ diffractometer (MoK $\alpha$ radiation, $\omega$ scan). Three standard reflections measured every 90 $m i n$ showed no significant change during the data collection. 2426 reflections with $|F|>5 \sigma(|F|)$ were retained for solving and refining the structure, and corrected for Lorentz and polarization effects and empirically for absorption (maximum and minimum transmission coefficients, 0.578 and 0.498 ).

The bromine atom was used to fix the arbitrary origin, the remaining atoms being readily located in successive $\Delta \mathrm{F}$ maps. Non-hydrogen atoms were refined anisotropically by full-matrix least squares calculations, minimizing $\Sigma w\left(\mathrm{~F}_{0}-\mathrm{F}_{\mathrm{c}}\right)^{2}$, with $\mathrm{w}^{-1}=\sigma^{2}(\mathrm{~F})+0.0006 \mathrm{~F}^{2}$. Hydrogen atoms were idealized with
a fixed isotropic thermal parameter 1.2 times the equivalent isotropic thermal parameter of their parent carbon atoms. An isotropic extinction parameter was introduced and refined up to a value $\chi=4.6(8) \times 10^{-3}$. A multiplier for the $\Delta f^{\prime \prime}$ values was also refined, the value $\eta=0.98$ (4) being obtained, indicating that the chosen absolute configuration is correct. Final residues are: $\mathrm{R}=0.042, \mathrm{R}_{\boldsymbol{w}}=0.042, \mathrm{GOF}=1.36,|\Delta \rho|<0.49$ e $/ \AA^{3}$.

All calculations and drawings were performed with the SHELXTL PLUS program package (12) on a Micro VAX II computer. Final non-hydrogen atomic coordinates are included in Table 6. ${ }^{2}$

Table 6. Atomic Coordinates $\left(\times 10^{4}\right)$ and Equivalent Isotropic Displacement Coefficients $\left(\AA^{2} \times 10^{3}\right)$.

*Equivalent isotropic $U$ defined as one-third of the trace of the orthogonalized $U_{i j}$ tensor.

Computational aspects.-The Allinger-Molecular mechanics methodology (13) for theoretical calculations was used through the PC-Model software (14) on an IBM-PC-compatible computer. Minimization was performed using the MMX forcefield, which is a modification of the MM2 (15) and MMP1 (16) Allinger's programs by J.J. Gajewski and K.E. Gilbert. The current version of MMX recognizes nearly 60 different atom types. Conformational analyses were performed using the MULTOR option of the PC-Model program, rotating all the possible side-chains of the structures considered. In some cases, a collection of conformers of minimum energies and their corresponding Cartesian coordinates could be obtained. The theoretical ${ }^{3} \mathrm{~J}$ H-H coupling constants and the relative populations were calculated through the 3JHH2 PROGRAM (17), which is set up in the use of an extended multiparametric Karplus equation (18) mixing the above minimum energy Cartesian coordinates.

Received 15 October 1993

[^0]:    ${ }^{2}$ Chemical shifts in $\delta$ (ppm). Assignments were supported by DEPT experiments.
    ${ }^{\text {b-d }}$ Signal assignments with the same letter may be interchanged.

[^1]:    ${ }^{3}$ Coordinates for these compounds were obtained via the Cambridge Structural Data Base (11).

[^2]:    ${ }^{2}$ Hydrogen coordinates, thermal parameters, bond distances and angles, and observed and calculated structure factors have been deposited with the Cambridge Crystallographic Data Centre and can be obtained on request from Dr. Olga Kennard, University Chemical Laboratory, 12 Union Road, Cambridge CB2 1EZ, UK.
